PREFACE

"*Cancer in Idaho - 2003*," the twenty-seventh annual report of the Cancer Data Registry of Idaho (CDRI), contains data on cancer cases diagnosed during 2003 among Idaho residents. These data can be used by public health officials, hospital administrators, physicians, and others to effectively plan services, prioritize health resource allocations, develop and measure prevention and intervention strategies, and identify high risk populations within the state of Idaho.

ACKNOWLEDGMENTS

The Idaho Hospital Association (IHA) contracts with, and receives funding from, the Idaho Department of Health and Welfare, Division of Health, to provide a statewide cancer surveillance system.

The statewide cancer registry database is a product of collaboration among many report sources including: hospitals, physicians, surgery centers, pathology laboratories, and other states in which Idaho residents are diagnosed and/or treated for cancer. Their cooperation in reporting timely, accurate, and complete cancer data is acknowledged and sincerely appreciated.

CDRI would also like to thank the Idaho Bureau of Health Policy and Vital Statistics, the Bureau of Clinical and Preventive Services, the Bureau of Community and Environmental Health, and the Office of Epidemiology and Food Protection of the Idaho Department of Health and Welfare, Division of Health, for their continued partnership in using CDRI data as a tool in cancer control and prevention.

This publication was supported by Cooperative Agreement Number U55/CCU021915 from the Centers for Disease Control and Prevention. Its contents are solely the responsibility of the authors and do not necessarily represent the official views of the Centers for Disease Control and Prevention.

BACKGROUND

Introduction to the Cancer Data Registry of Idaho (CDRI)

Purpose of the Registry

Population-based cancer registries are essential for assessing the extent of cancer burden in a specified geographic area. The Cancer Data Registry of Idaho (CDRI) is a population-based cancer registry that collects incidence and survival data on all cancer patients who reside in the state of Idaho or who are diagnosed and/or treated for cancer in the state of Idaho. The goals of the CDRI are to:

- ◆ determine the incidence of cancer in the state of Idaho with respect to geographic, demographic, and social characteristics;
- ◆ monitor trends and patterns of cancer incidence over time;
- ◆ identify high risk populations;
- ◆ provide a database and serve as a resource in conducting epidemiologic studies; and
- ◆ provide data to assist public health officials, hospital administrators, and physicians to effectively plan services, prioritize health resource allocations and develop and measure prevention and intervention strategies.

History and Funding of the Registry

CDRI was established in 1969 and became population-based in 1971. The Idaho State Legislature has provided guidelines for the establishment, requirements, and funding of the statewide cancer registry. The operations of the registry are mandated by Idaho Code 57-1703 through 57-1707. Funding is appropriated in Idaho Code 57-1701 and 63-2520, which delineates a portion (less than one percent) of the cigarette tax to be dedicated to fund the statewide cancer registry. Additional

funding has been awarded to CDRI from the Centers for Disease Control and Prevention (CDC) to enhance timely, complete and accurate data collection, computerization, and reporting of reliable data.

Collection of Data

Each Idaho hospital, outpatient surgery center, and pathology laboratory is responsible for the complete ascertainment of all data on cancer diagnoses and treatments provided in its facility within six months of diagnosis. Sources for identifying eligible cases include:

- ◆ hospitals,
- ◆ outpatient surgery centers,
- ◆ private pathology laboratories,
- ◆ free-standing radiation centers,
- ◆ physicians (for patients not receiving cancer diagnoses and/or treatment in the above sources),
- ◆ death certificates, and
- ◆ other state cancer registries reporting an Idaho resident with cancer (as negotiated).

When a cancer case is reported from more than one source, the information is consolidated into one record.

Reported cases contain the following data:

- ◆ patient demographics (including geographic place of residence at time of cancer diagnosis);
- ◆ description of cancer (including date of diagnosis, primary site, metastatic sites, histology, extent of disease, etc.);
- ◆ first course treatment; and
- ◆ follow-up data for purposes of calculating survival rates.

Primary site, behavior, grade, and histology were coded according to the "*International Classification of Diseases for Oncology, 3rd edition.*"¹ Stage of disease variables were coded using "*SEER's Summary Staging Manual 2000*" and "*AJCC Manual for Staging of Cancer, 6th edition.*"²⁻³ All other variables were coded following the rules of the North American Association of Central Cancer Registries (NAACCR), the National Cancer Institute's SEER program, and the American College of Surgeons Commission on Cancer.⁴⁻⁶

Reportable Cases

All in-situ or malignant neoplasms are reportable to CDRI. The database includes all cases of carcinoma, sarcoma, melanoma, lymphoma, and leukemia, diagnosed by histology/cytology, radiology, laboratory testing, clinical observation, and autopsy.

Also reportable are benign tumors of the brain, meninges, pineal gland, and pituitary gland.

Basal and squamous cell carcinomas of the skin are excluded except when occurring on a mucous membrane or if the AJCC stage group is II, III, or IV.

Under Idaho Code and as recommended by NAACCR, cervix in-situ cases are not currently reportable.

Confidentiality of Data

Idaho state law ensures the protection of confidential data and restricts the release of identifying data. Only aggregate data are published. The same law protects report sources from any liability for reporting confidential data to CDRI. Persons with access to confidential data are required to sign a pledge of confidentiality and are subject to penalty if they, through negligence or willful misconduct, disclose confidential data.

Quality Assurance

To assure validity and reliability of data presented, CDRI has many mechanisms in place to check data for quality and completeness. CDRI uses EDITS software which has standard edits using algorithms that check the content of data fields against an encoded set of acceptable possible contents and flags the acceptability of coded data. Edits include field edits, inter-field edits, and inter-record edits. Edits check for unlikely sex/site, site/histology, or site/age combinations. In addition to computerized edits, each case is manually reviewed for errors.

Records are also routinely checked for duplicate entries. Duplicate case checking is performed both manually and electronically using various methodologies.

Idaho data have qualified for inclusion in all volumes of NAACCR's publication of "*Cancer Incidence in North America.*" In order to be included, states must meet standards for quality and completeness.

Executive Summary

Data Presentation

This report is comprised of five sections. Section I focuses on the 23 most common cancer sites and all sites combined and presents age-adjusted incidence rates, numbers of cases, numbers of deaths, counts by county, stage of disease at time of diagnosis, risk factors, special notes, age-adjusted incidence rate comparisons by health district, and age-specific rates by gender. Section II depicts incidence data by site and gender for invasive and in-situ cases. Section III depicts mortality data by site and gender. Section IV contains a table of age-specific cancer rates, per 100,000, by site and gender. Section V contains a table of observed versus expected numbers of cancer cases by health district. Section VI contains tables of age-specific risks of developing and dying from cancer for males and females. For more detailed statistics by county, see CDRI's "County Cancer Profiles" at www.idcancer.org.

Population Description

The population of the state of Idaho on July 1, 2003, was estimated to be 1,366,332 (684,815 males and 681,517 females). Population estimates were obtained from the U.S. Bureau of the Census.⁷ Idaho is comprised of 44 counties grouped into seven health districts. The composition of the health districts, as well as their population estimates by gender as used in this report, are shown below:

<u>Health District</u>	<u>Counties</u>	<u>Male</u>	<u>Female</u>
District 1	Benewah, Bonner, Boundary, Kootenai, Shoshone	93,804	95,034
District 2	Clearwater, Latah, Lewis, Idaho, Nez Perce	51,008	49,340
District 3	Adams, Canyon, Gem, Owyhee, Payette, Washington	106,511	106,954
District 4	Ada, Boise, Elmore, Valley	186,965	182,037
District 5	Blaine, Camas, Cassia, Gooding, Jerome, Lincoln, Minidoka, Twin Falls	83,826	83,618
District 6	Bannock, Bear Lake, Bingham, Butte, Caribou, Franklin, Oneida, Power	78,641	79,625
District 7	Bonneville, Clark, Custer, Fremont, Jefferson, Lemhi, Madison, Teton	84,060	84,909

Descriptive Summary by Gender and Race and Ethnicity

The data presented in this report cover those cases diagnosed among Idaho residents between January 1, 2003, and December 31, 2003. In this time frame, there were 6,187 cases of cancer diagnosed among Idaho residents (3,209 among males and 2,978 among females). By race and ethnicity, there were 5,847 cases among non-Hispanic whites, 184 among Hispanic whites, 10 cases among Blacks, 26 cases among Native Americans, 15 cases among Asians/Pacific Islanders, and 13 cases among other races. Race was missing for 105 cases. The majority of cases with missing race and/or ethnicity were reported by out-of-state sources. The number of cancer cases treated in outpatient settings and reported only by pathology laboratories has increased over the last several years. Many of such cases are reported with missing demographic variables, causing tabulations of cases by race to be skewed. CDRI is actively working to improve the data quality of cases reported by pathology laboratories only. CDRI has conducted matches with the Indian Health Service and Northwest Portland Area Indian Health Board to improve the accuracy of race information collected on Native Americans, and uses the NAACCR Hispanic Identification Algorithm to identify Hispanics by birthplace/race/surname. For more detailed statistics by race and ethnicity, see *Cancer in Idaho by Race and Ethnicity: 1990-2001*.¹⁵

Trends

There was a slight decrease in the number of reported cases from 2002 to 2003 (a decrease of 18 cases from 2002 to 2003 as of one year after close of calendar year). Cancer sites with notable decreases from 2002 to 2003 were cervix, endometrium, and myeloma. There was a notable increase from 2002 to 2003 in the number of skin melanoma cases.

Summary Measures of Cancer Burden

New for 2003 is a table of summary measures of cancer burden in Idaho. This table includes 2003 numbers of cancer cases, cancer deaths, median ages at diagnosis and death, estimated cancer prevalence, and years of potential life lost before age 75 by persons who died of cancer. It is hoped that this information will be useful in Idaho's comprehensive cancer control efforts.

SUMMARY MEASURES OF CANCER BURDEN IN IDAHO - 2003

Primary Site	Incident Cases	Deaths	Median Age at Diagnosis	Median Age at Death	Estimated Prevalence Count	Total Number of YPLL Before Age 75	Average Number of YPLL per Death, Persons Aged Less than 75 Years	% Change Incidence Rate 2002 to 2003
All Sites	5,790	2,318	67.0	73.0	37,471	17,051	13.6	-2.9%
Bladder	248	54	74.0	81.5	1,833	180	10.6	-9.7%
Brain	87	83	56.0	59.0	386	1,576	21.0	-12.8%
Breast	811	172	61.0	67.5	8,198	1,826	16.6	-11.5%
Cervix	42	14	48.5	71.0	633	141	15.6	-21.0%
Colorectal	584	216	72.0	75.0	3,546	1,261	12.1	4.3%
Endometrium	119	16	64.0	74.5	1,872	69	8.6	-15.8%
Esophagus	60	57	66.0	66.0	77	520	12.1	11.8%
Hodgkin Lymphoma	46	6	28.5	71.0	558	72	18.0	9.9%
Kidney	166	64	63.0	71.0	825	564	13.4	-3.7%
Larynx	42	16	66.0	80.0	310	57	14.3	-10.0%
Leukemia	191	125	70.0	75.0	811	1,240	20.3	5.0%
Liver	37	41	64.0	64.0	33	550	19.6	-4.3%
Lung	734	591	71.0	72.0	1,053	3,565	10.3	7.2%
Melanoma of Skin	307	45	59.0	68.0	2,366	603	22.3	15.2%
Myeloma	47	38	73.0	77.0	205	192	12.0	-40.6%
Non-Hodgkin Lymphoma	233	111	70.0	76.0	1,378	785	14.8	-9.5%
Oral Cavity and Pharynx	139	31	64.0	72.0	1,081	239	12.6	0.7%
Ovary	75	55	65.0	71.0	686	362	11.0	-5.8%
Pancreas	145	128	69.0	74.0	109	851	12.9	-5.6%
Prostate	948	150	69.0	82.0	7,619	224	6.8	-4.1%
Stomach	73	30	71.0	77.0	172	163	11.6	-3.7%
Testis	38	1	36.5	-	670	-	-	8.0%
Thyroid	131	12	49.0	65.5	1,300	120	15.0	7.7%

Notes:

Incident cases include all invasive and bladder in situ cases newly diagnosed among Idaho residents in 2003.

Cancer prevalence is the number of people alive today who have been diagnosed with cancer. This includes individuals who were newly diagnosed, are in active treatment, have completed active treatment, and those living with progressive symptoms of their disease. Limited-duration prevalence was estimated from long-term incidence and survival rates from 1970 to 2003 but underestimates complete prevalence due to an unknown number of live cases diagnosed prior to 1970.

Years of potential life lost (YPLL) is a statistic used to measure the number of years of life lost in a population when persons in that population die prematurely (standard of 75 years of age used for this table).

Technical Notes

Age-adjusted Incidence Rates

Age-adjusted incidence rates published within this report were adjusted using the direct method and standardized to the age distribution of the 2000 U.S. population (see Appendix B for the 2000 U.S. standard population). Incidence rates represent the average number of new cases diagnosed annually per 100,000 persons. Age adjustment allows rates from one geographic area to be compared with rates from other geographic areas that may have differences in age distributions. Any observed differences in age-adjusted incidence rates between populations are not due to differing age structures.

Because the 2000 U.S. standard population was used to age-adjust rates, the age-adjusted rates published in this report are not comparable with age-adjusted rates published in CDRI annual reports for incident years prior to 1999.

The computation of rates requires reliable estimates of the population at risk by five-year age groups and gender during the time period being studied. Population figures used in this report were obtained from the U.S. Bureau of the Census (see Appendix C).⁷

In conformity with the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program guidelines, the incidence rates excluded the following:

- ◆ in-situ cases, except bladder;
- ◆ basal and squamous cell skin cancers;
- ◆ cases with unknown age; and
- ◆ cases with unknown gender.

Of the total number of invasive and in-situ cases for 2003 (6,187), a total of 5,790 cases (5,651 invasive and 139 bladder in-situ) were used for calculating age-adjusted incidence rates. Of the 5,790 cases, 3,081 occurred among males and 2,709 occurred among females.

Age-specific Incidence Rates

Age-specific rates are calculated by dividing the number of cases for a given age group by the total population of that age group and are expressed as an average annual rate per 100,000 population by age group. Age-specific rates exclude the same types of cases that are excluded from age-adjusted incidence rates.

Observed vs. Expected Numbers of Cases

The expected numbers of cases were calculated using the indirect method of age-adjustment. For each health district, the expected numbers of cases were calculated using rates for the remainder of Idaho. The observed and expected numbers exclude in-situ cases (except bladder), basal and squamous cell skin cancers, and cases with unknown age or sex. Cases with unknown county of residence were not included in the observed numbers of cases. Statistically significant differences between observed and expected cases (standardized incidence ratios) were marked (+) for $p \leq 0.05$ and (*) for $p \leq 0.01$. Statistical significance does not necessarily imply that concern is warranted, since differences can occur as a result of multiple factors.

Risk and Associated Factors

The “risk and associated factors” subsections in Section I were developed from extracts of “Cancer Epidemiology and Prevention,” the American Cancer Society’s “Clinical Oncology,” and the U.S. Department of Health and Human Services 11th Report on Carcinogens.⁸⁻¹⁰ Socio-economic status is abbreviated as SES in Section I text.

Mean/Median/Mode

Measures of central tendency are helpful to describe a group of individual values in a simple and concise manner.

Mean also known as the arithmetic average, is the sum of all observations divided by the number of observations.

Median is the middle value when the observations are ranked in order from the smallest to the largest.

Mode is the value which occurs most frequently in a group of observed values.

Confidence Intervals

An estimated range of values within which the true population value lies with given probability is the confidence interval.

Cancer Case Definition

A “cancer case” is defined as a primary cancer site (where the cancer started), not a metastatic cancer site (where the cancer spread to). Since an individual can have more than one primary cancer site during their lifetime, the number of incident cancer cases is greater than the number of persons who are diagnosed with cancer.

Limitations to Data Interpretation and Comparison

Rates based on population estimates: In non-census years, state and county population figures are estimates. Errors in the estimates will impact the rates.

Rate comparisons: Age-adjusted incidence rates and age-specific rates based on small numbers of cases (fewer than 10 cases) may be unstable. In comparing rates among geographic areas (counties, health districts, or states), factors such as the absolute numbers of cases and differences in demographics should be considered. Interpretations without consideration of these factors may be misleading or inaccurate.

Racial misclassification: Many source documents used to report cancer do not specify race of the patient, or misclassify race. This can result in substantial bias, and is the reason why race-specific rates are not published in this report. For more detailed statistics by race and ethnicity, see *Cancer in Idaho by Race and Ethnicity: 1990-2001*.¹⁵

Standard Site Analyses Categories

To facilitate interpretation of data and comparisons across registries, CDRI uses standardized groupings of site analysis categories. These groupings are consistent with the National Cancer Institute’s SEER Program and are adopted by NAACCR.^{4,5} Most neoplasms are grouped by the organ where they occur. Neoplasms of the lymphatic, hematopoietic, and reticuloendothelial systems are grouped by their histologies (leukemias, lymphomas, etc.), and not by the anatomic site where they occurred. Melanoma of the skin is a combination of both anatomic site and histologic type. See Appendix A for groupings of codes.

SEER

Part of the National Cancer Institute, the Surveillance, Epidemiology, and End Results (SEER) program consists of several population-based cancer registries throughout the U.S. SEER cancer statistics are designed to be representative of the U.S. population, and are included for reference in Section I of this report. SEER rates for Section I were calculated using SEER*Stat.¹¹ For comparisons between Idaho and SEER rates, see the CDRI publication *Cancer Trends in Idaho, 1971-1998*.

Stage at Time of Diagnosis

Staging measures the extent of disease at the time of initial diagnosis. Summary staging attempts to group cases with similar prognoses into categories of:

- ◆ in-situ (non-invasive),
- ◆ localized (cancer confined to the primary site),
- ◆ regional (direct extensive of tumor to adjacent organs, and/or lymph nodes),
- ◆ distant (metastasis to tissues or lymph nodes remote from the primary site), or
- ◆ unstaged.

Risks of Developing and Dying from Cancer

Cancer incidence and mortality risks were estimated using DEVCAN Version 5.3 software.¹² DEVCAN was used to calculate the probability of developing or dying of cancer using Idaho-specific cancer incidence and mortality data for the years 1999-2003. The estimates generated are similar to estimates derived using incidence data from the Surveillance, Epidemiology, and End Results (SEER) Program of the National Cancer Institute, mortality data from the National Center for Health Statistics, and population estimates from census data. DEVCAN was developed by Information Management Services, Inc. in consultation with the Applied Research Branch of the National Cancer Institute. DEVCAN uses a standard multiple decrement life table.

Limited-Duration Prevalence

Limited-duration prevalence represents the number of people alive on a certain day who had a diagnosis of the disease within the past x years. SEER*Stat's prevalence calculations use the counting method to estimate prevalence from incidence and follow-up data. The counting method estimates prevalence by counting the number of persons who are known to be alive at a specific calendar time and adjusting for those lost to follow-up.

SECTION I

2003 SUMMARY ON ALL SITES COMBINED AND 23 MOST COMMON SITES

ALL SITES

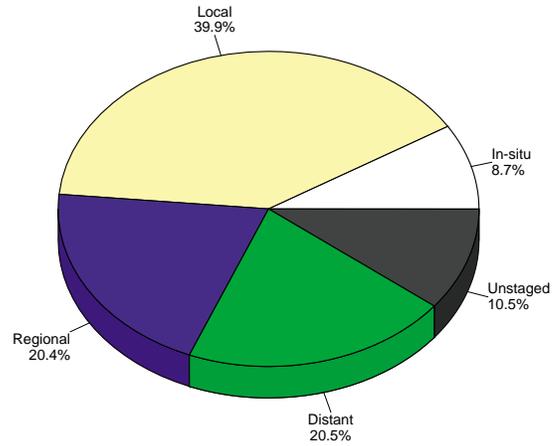

Incidence and Mortality Summary

	Total	Male	Female
Age-adjusted incidence rate per 100,000	446.5	520.5	392.7
# of new invasive cases	5,651	2,970	2,681
# of new in-situ cases	536	239	297
# of deaths	2,318	1,239	1,079

Total Cases By County

Ada	1,465	Cassia	90	Lewis	44
Adams	21	Clark	-	Lincoln	19
Bannock	289	Clearwater	42	Madison	51
Bear Lake	20	Custer	20	Minidoka	94

Canyon	607	Latah	128	Washington	65
Caribou	35	Lemhi	37		

Stage at Diagnosis - All Sites

Risk and Associated Factors

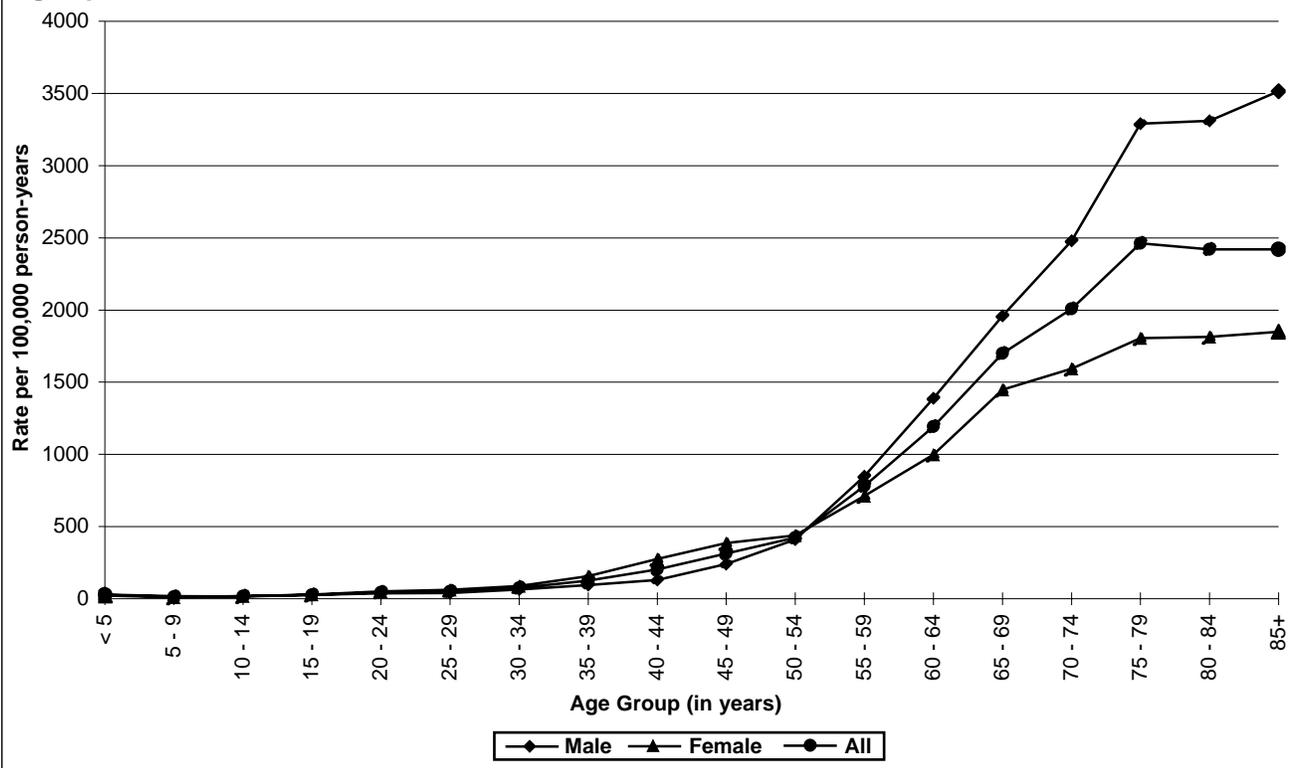

Age	Rates usually increase steadily with age. Most cases are adults in mid-life or older.
Gender	Males have a higher incidence than females for most cancer types.
Race & SES	Rates are higher for African Americans than for Caucasians and other ethnic groups. Rates are generally higher among lower income groups.
Occupation	Risk for cancer is greater with some kinds of workplace exposures, such as some chemicals, asbestos, and radiation.
Diet	Diets that are low in fresh fruits and vegetables have been associated with increased incidence of several cancers.
Other	Tobacco use is the single most important risk factor for cancer incidence and mortality. Most cancers manifest a tendency to aggregate in families - close relatives of a cancer patient can be considered to have increased risk of that neoplasm, but not all forms of cancer. Excess risk is usually 2-3x baseline, but in some (rare) families may be hundreds-fold.

Special Notes

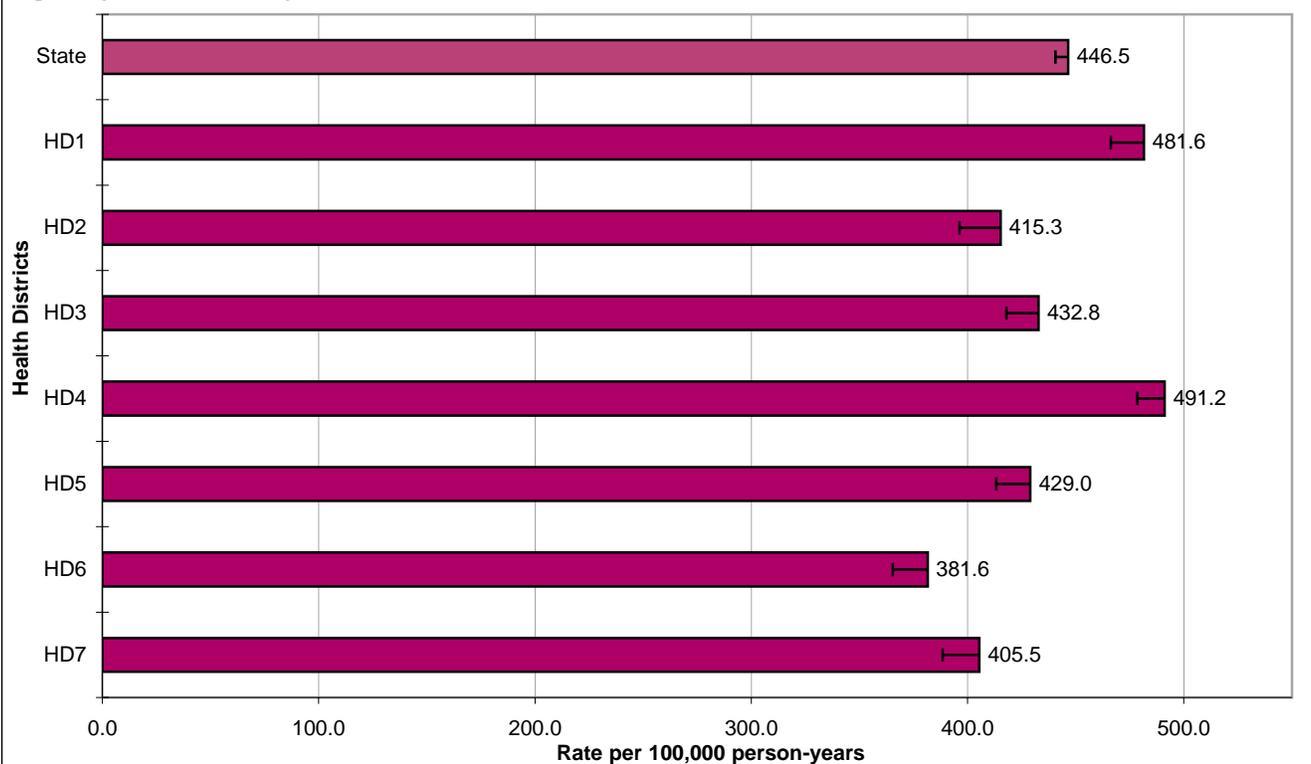

Mean age-adjusted incidence rate across health districts:	433.8
95% confidence interval on the mean age-adjusted incidence rate:	404.4 - 463.3
Median age-adjusted incidence rate of health districts:	429.0
Range of age-adjusted incidence rate for health districts:	381.6 - 491.2
SEER rate (2001, Whites):	478.2

The incidence rates for all cancers combined were similar for males and females in Idaho until approximately age 60-64, after which rates for males rose dramatically. The highest rates for both males and females were observed in age groups after age 70, peaking in the age group 85+ for males and females. Health Districts 1 ($p < 0.05$) and 4 ($p < 0.01$) had statistically significantly more cases of cancer than expected based upon rates for the remainder of Idaho, and Health Districts 6 ($p < 0.01$) and 7 ($p < 0.01$) had statistically significantly fewer cases than expected.

Caribou	2	Lemhi	3		

Stage at Diagnosis - Bladder

Risk and Associated Factors

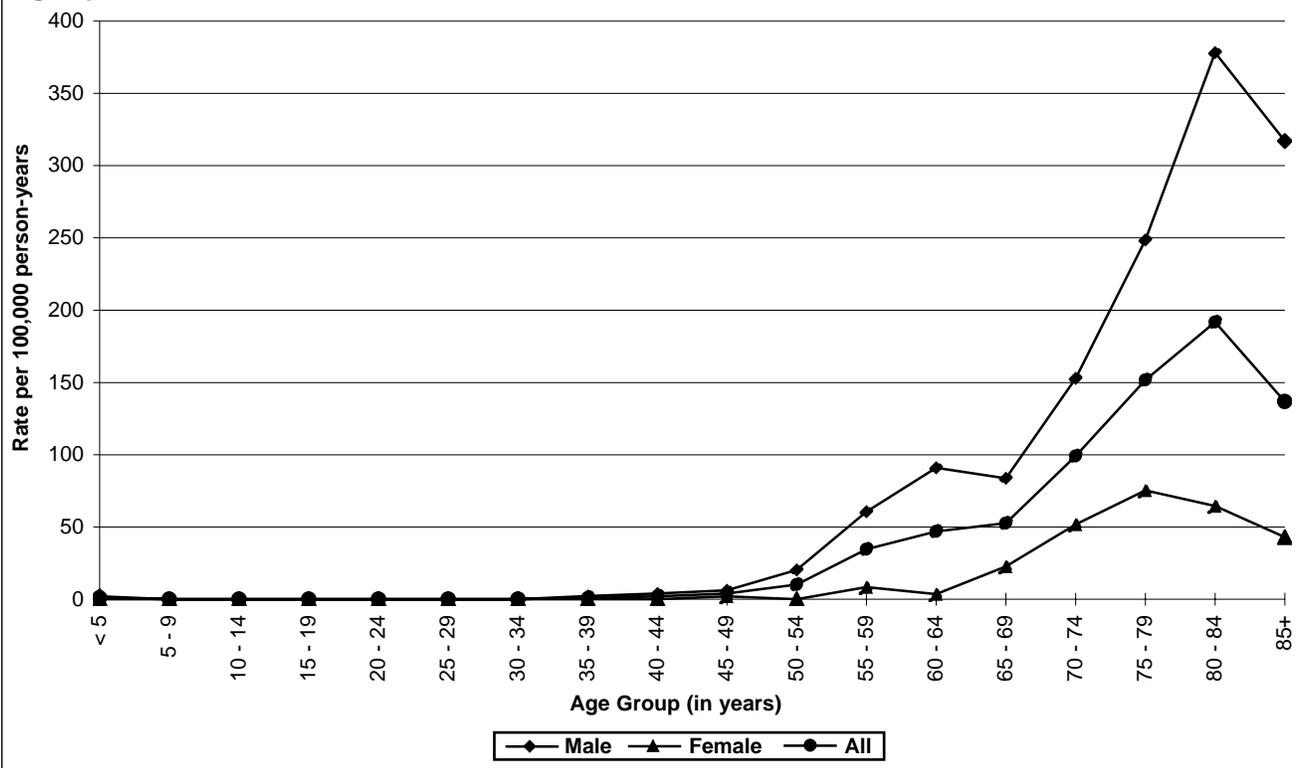

Age	Rates usually increase steadily with age.
Gender	Males have substantially higher rates than females.
Race	Incidence rates are higher in Caucasians.
Occupation	Truck drivers, likely via exposure to motor exhaust, are at increased risk. Occupational exposures, including those to manufacturers of certain dyes, painters, and aluminum, rubber, cable, and leather workers, have been shown to increase risk of bladder cancer. Exposure to permanent hair dyes may increase risk.
Other	Tobacco consumption has been associated with a 2- to 5-fold higher incidence of bladder tumor and is attributable for a greater number of cases than other risk factors. Cyclophosphamide, a chemotherapeutic agent, and 4-amino-diphenyl are known human bladder carcinogens. Schistosoma hematobium may cause bladder tumors. Nitrate and arsenic in drinking water, and chlorinated surface water as a source for drinking water, have each been shown to increase the risk of bladder cancer.

Special Notes

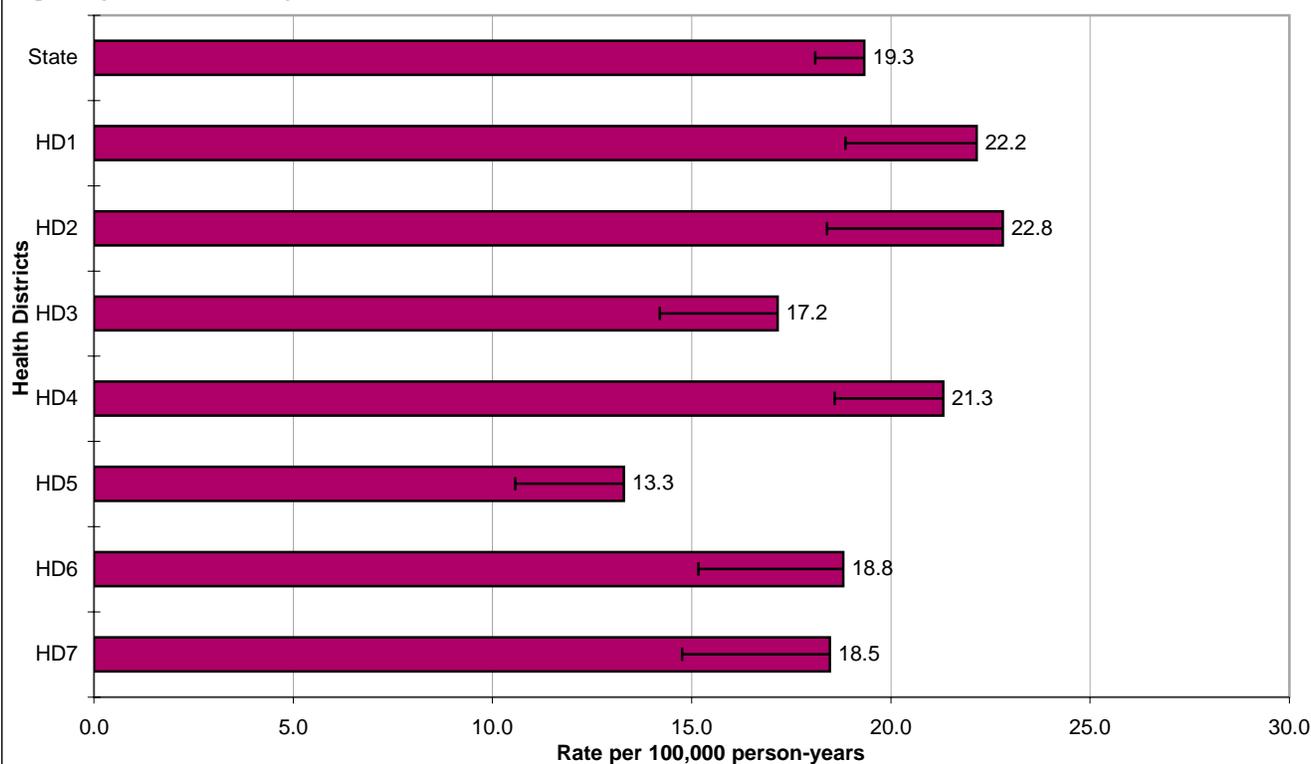

Mean age-adjusted incidence rate across health districts:	19.1
95% confidence interval on the mean age-adjusted incidence rate:	16.7 - 21.6
Median age-adjusted incidence rate of health districts:	18.8
Range of age-adjusted incidence rate for health districts:	13.3 - 22.8
SEER rate (2001, Whites):	23.1

There were few cases of bladder cancer among persons aged less than 40 years. Bladder cancer incidence rates increased with age, peaking in the age group 80-84 for males and 75-79 for females. Health District 5 had statistically significantly fewer cases than expected based upon rates for the remainder of Idaho ($p < 0.05$).

Stage at Diagnosis - Brain

Risk and Associated Factors

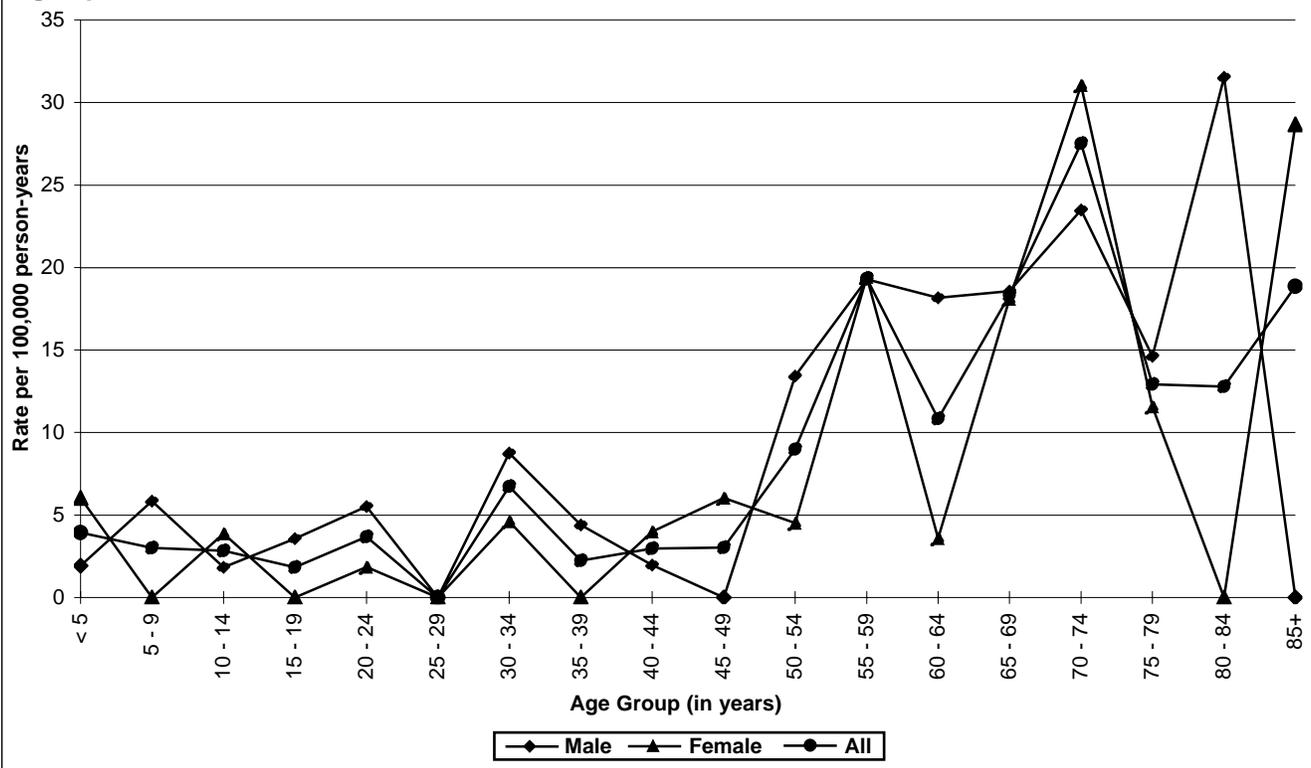

Age	This is the second most common cancer among children, following leukemia. Adult malignant brain tumors are most common after age 60.
Gender	Males have higher rates than females.
Race & SES	The incidence rate is higher in Caucasians and higher social classes.
Genetics	Certain genetic factors may cause an increased risk of some malignant brain tumors, including gliomas, but the proportion of brain tumors attributable to inheritance is likely no more than 4%. Molecular tests that may be useful in screening for recurrences are being developed.
Occupation	Vinyl chloride and ionizing radiation exposure are risk factors. Many occupational and environmental exposures have shown suggestive associations with elevated rates of brain cancer. Roofers, sheet metal workers, and rubber and plastic workers may be at elevated risk. Specific exposures underlying these associations have been suggested but not established.
Other	Human Immunodeficiency Virus (HIV) infected individuals and organ transplant recipients have an increased risk of developing brain lymphoma.

Special Notes

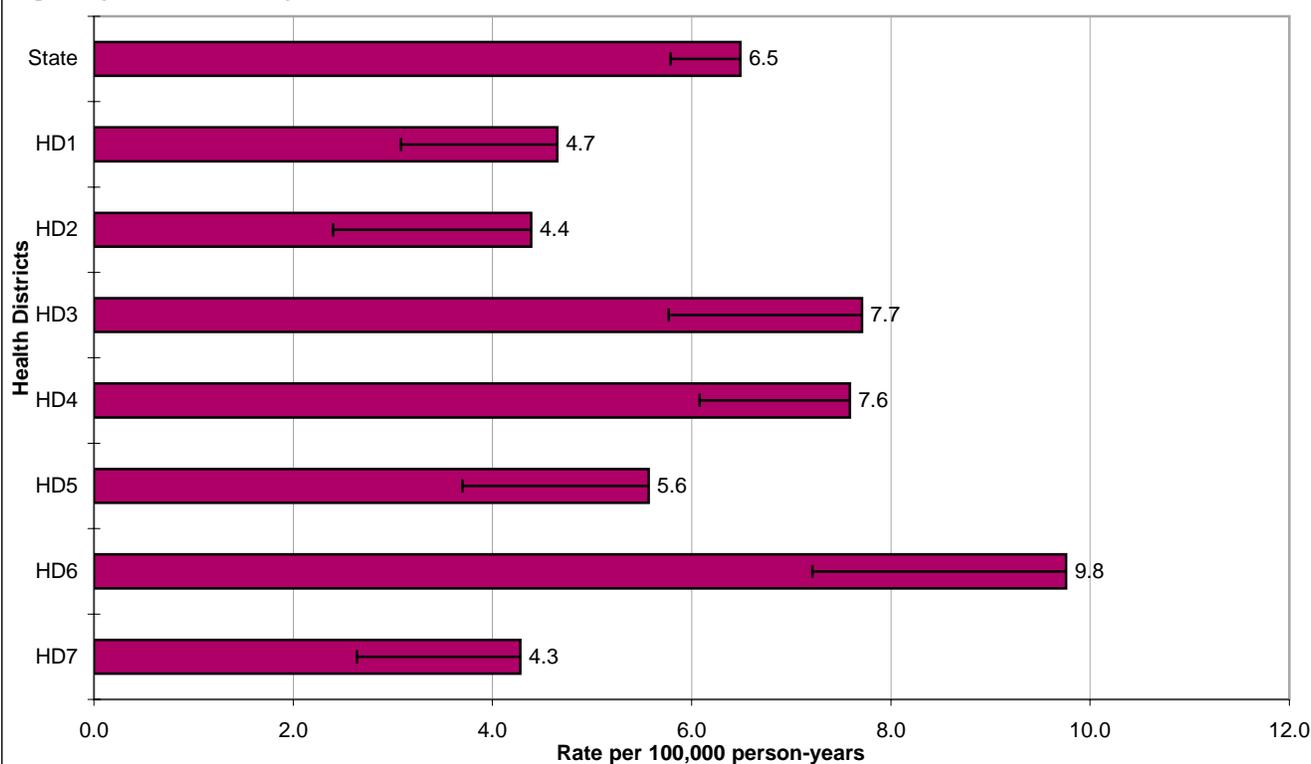

Mean age-adjusted incidence rate across health districts:	6.3
95% confidence interval on the mean age-adjusted incidence rate:	4.7 - 7.8
Median age-adjusted incidence rate of health districts:	5.6
Range of age-adjusted incidence rate for health districts:	4.3 - 9.8
SEER rate (2001, Whites):	6.6

The age-related incidence of brain cancer is typically bimodal, usually with a peak in infancy and childhood, a gradual rise in young adulthood, and a broader, sustained peak during the fifth to eighth decade of life. This trend is difficult to discern in Idaho's population due to the relatively small number of cases observed annually, which increases the variability in age-specific rates. No health districts had statistically significantly more, or fewer, cases than expected based upon rates for the remainder of Idaho.

Canyon	79	Latah	21	Washington	8
Caribou	8	Lemhi	5		

Stage at Diagnosis - Breast

Risk and Associated Factors

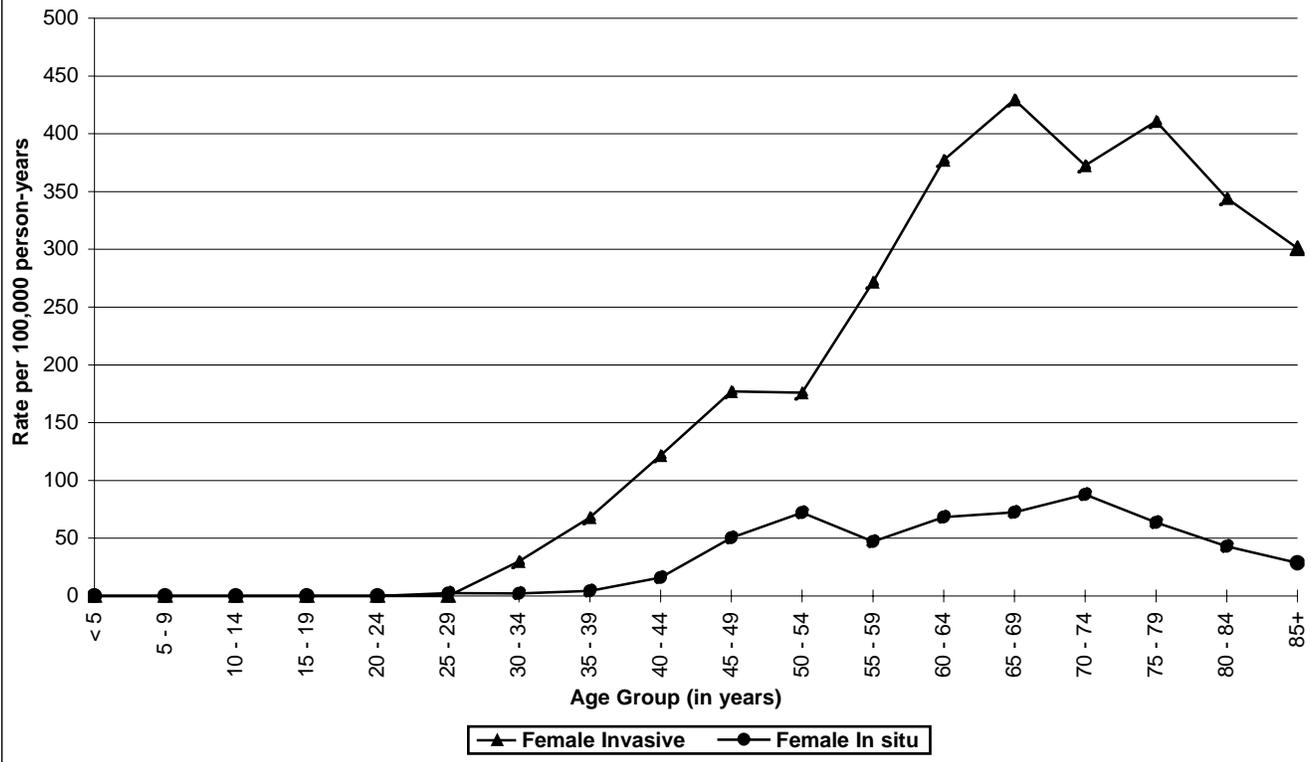

Age	Rates increase steadily with age. Age is the single most important risk factor for breast cancer. A 60-year old white American woman's risk of developing breast cancer is fourteen times that of a 30-year old American woman.
Race & SES	Caucasians have higher incidence rates as do women in higher income groups.
Genetics	Specific genes associated with breast cancers have been identified and are being studied. Identical twins of women with breast cancer have triple the risk of getting the disease themselves.
Hormonal	There is evidence of hormonal influence in the risk of developing breast cancer. Longer intervals of menarche to the first full-term pregnancy and menarche to menopause, as well as menarche before age 13, have been associated with higher risks of breast cancer. Cumulative estrogen exposure, including use of hormone replacement therapy, increases breast cancer risk.
Other	Alcohol consumption, high dietary fat intake, obesity (in postmenopausal women), sedentary life-style, and having a mother or sister with breast cancer have all been implicated as associated risk factors. Epstein-Barr virus may increase the risk of metastasis.

Special Notes

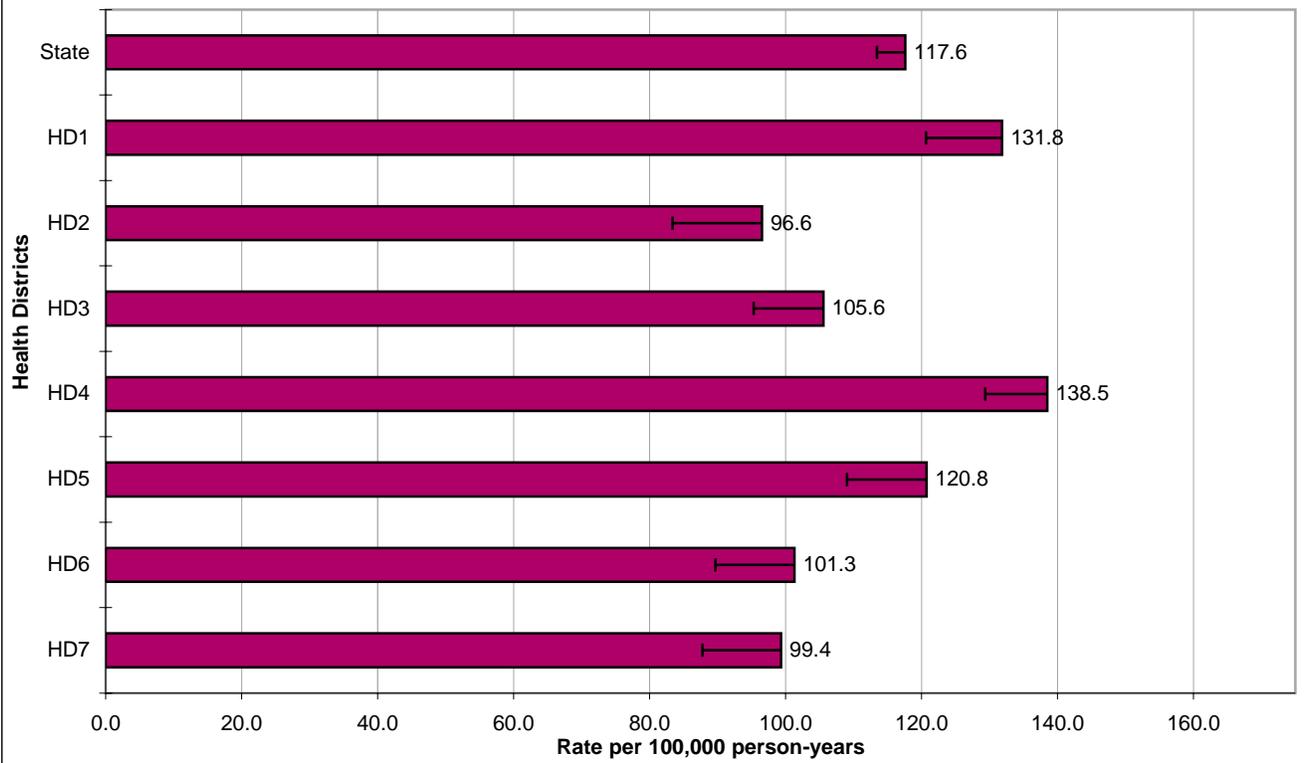

Mean age-adjusted incidence rate across health districts:	113.4
95% confidence interval on the mean age-adjusted incidence rate:	100.9 - 125.9
Median age-adjusted incidence rate of health districts:	105.6
Range of age-adjusted incidence rate for health districts:	96.6 - 138.5
SEER rate (2000, White females):	140.8

The vast majority of breast cancer cases occur among females. In Idaho during the year 2003, there were ten cases of invasive breast cancer among males. The age-specific incidence rates of female breast cancer in Idaho in 2003 increased with age, peaking in the age group 65-69 for invasive cases and 70-74 for in situ. No cases were observed in women less than 25 years of age. Health District 4 ($p < 0.01$) had statistically significantly more cases of female breast cancer than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Cervix

Risk and Associated Factors

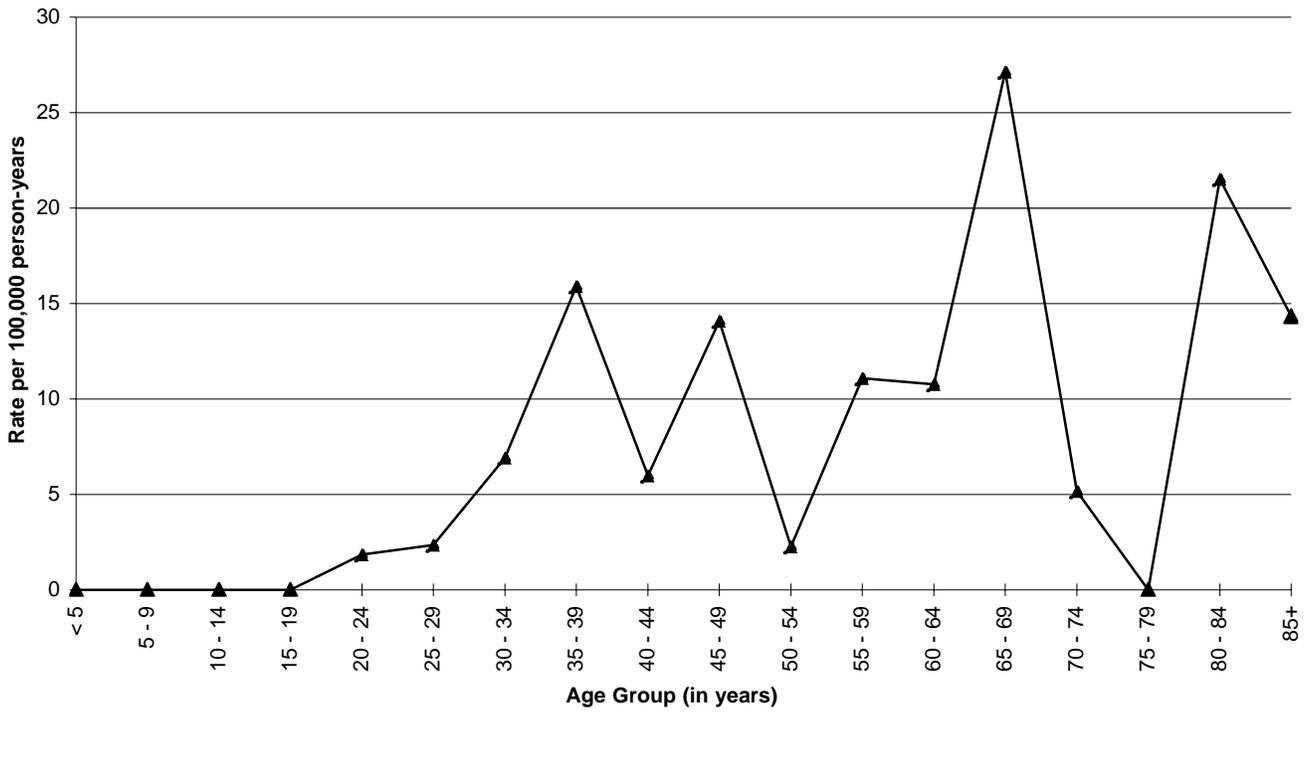

- Age** Cervical cancer occurs in adult women of any age. However, the majority of invasive cases are diagnosed in older women.
- Race & SES** African American females, as well as women in lower income groups, have been shown to experience higher rates.
- Other** The large majority of cervical cancer cases worldwide can be attributed to human papilloma virus (HPV) infection. Of the at least 70 types of HPV known, types 16 and 18 are most closely associated with malignancy. Other risk factors that may be correlates, cofactors, or independent risk factors of HPV infection include: early age at first intercourse (less than 16 years old), a history of multiple sexual partners, a large number of pregnancies, oral contraceptive use, a history of other sexually transmitted diseases, and the presence of other genital tract neoplasia. Exposure to cigarette smoke is also a known risk factor, although by unknown mechanisms. Diethylstilbestrol use during pregnancy increased clear-cell adenocarcinoma in daughters exposed in utero.

Special Notes

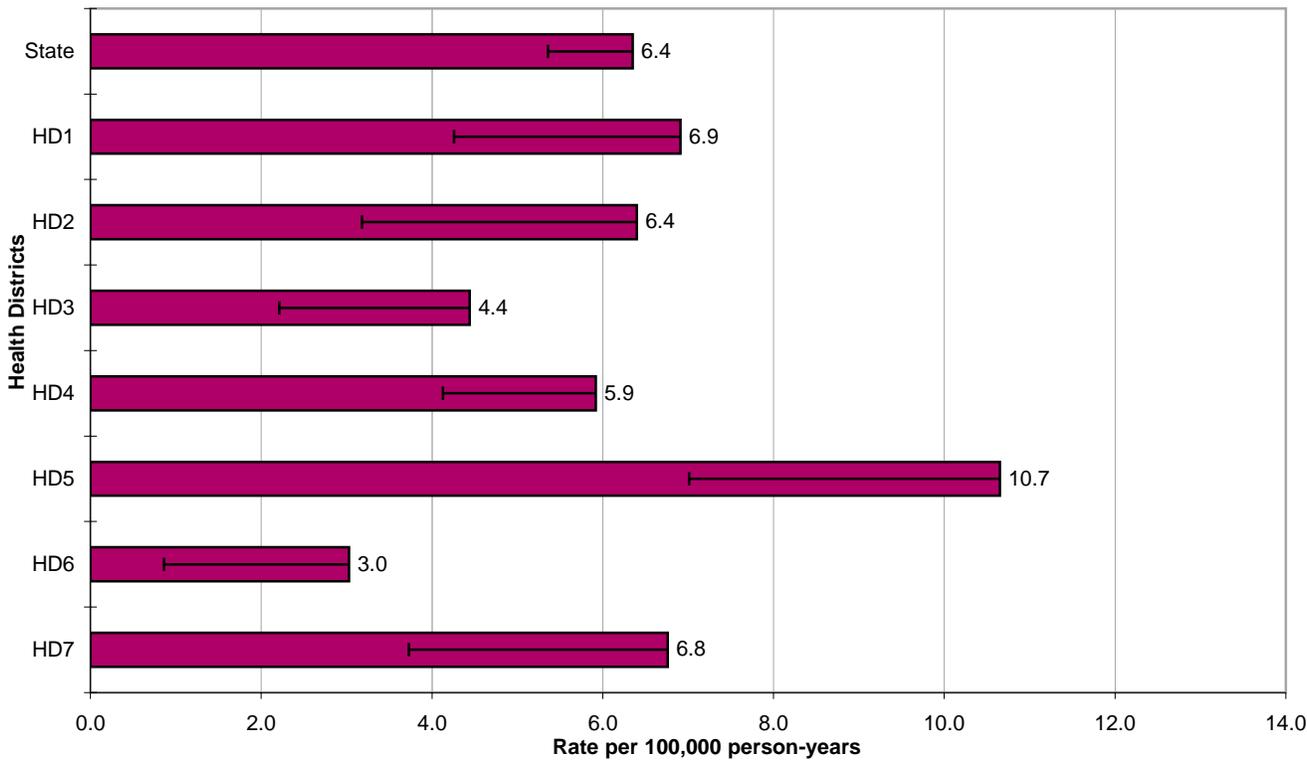

Mean age-adjusted incidence rate across health districts:	6.3
95% confidence interval on the mean age-adjusted incidence rate:	4.5 - 8.1
Median age-adjusted incidence rate of health districts:	6.4
Range of age-adjusted incidence rate for health districts:	3.0 - 10.7
SEER rate (2001, Whites):	7.3

No cases of invasive cervical cancer were diagnosed in females less than 20 years of age. Increased screening with routine Pap tests, particularly among older and low-income women, has increased diagnostic rates and helped to reduce the incidence of invasive disease. Today, the vast majority of cases in younger women is diagnosed before the invasive stage, with cure rates approaching 100%. These pre-invasive cases are not included in this report. No health district had statistically significantly more, or fewer, cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Colorectal

Risk and Associated Factors

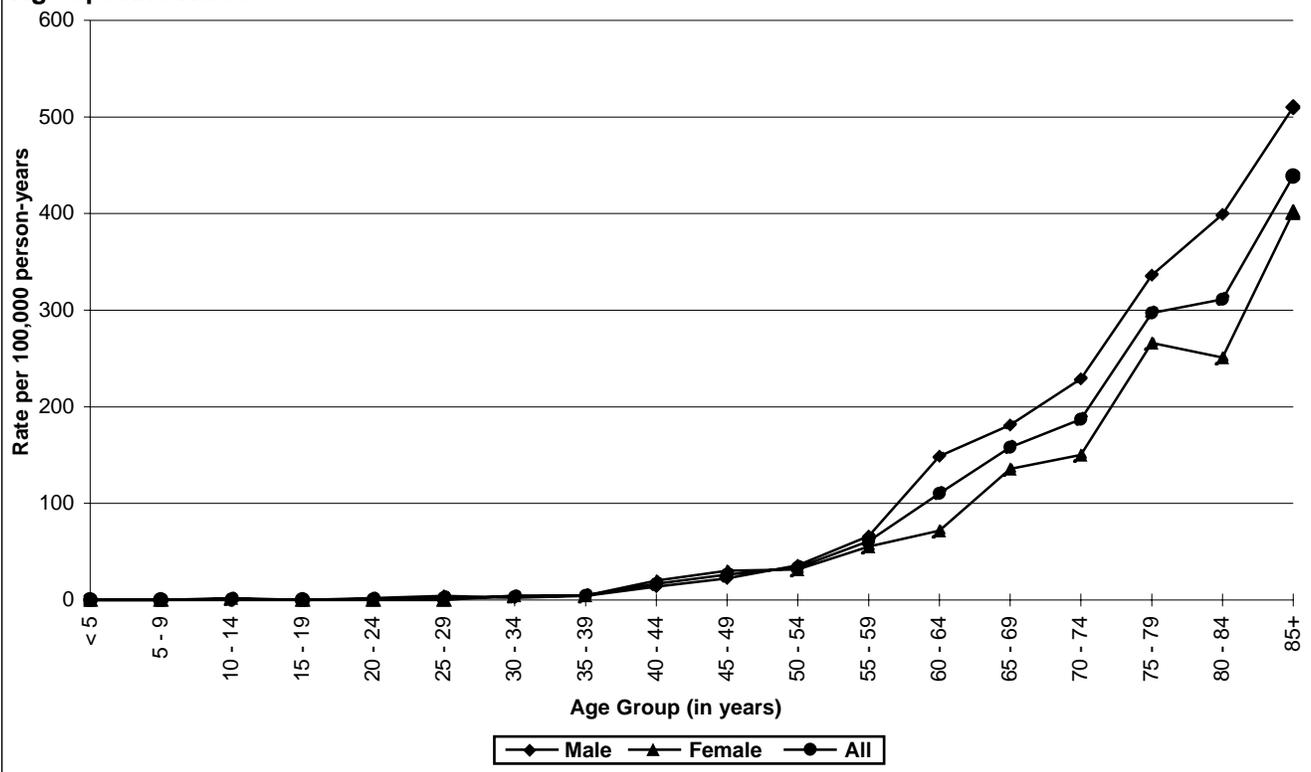

Age	Rates increase with age; the vast majority of cases occur after age 50.
Gender	Incidence rates are slightly higher in males.
Genetics	Specific genetic alterations have been recognized in several hereditary conditions with high risk of colon cancer, such as familial polyposis. These conditions account for about six percent of colon cancer cases.
Diet	Strong evidence that high calorie diets and diets high in fat and low in fiber contribute to increased risk of colon cancer has been shown.
Other	Individuals with a close family history of this cancer and those with a personal history of certain other cancers are at increased risk. Regular, moderate physical activity is associated with lower rates of this cancer. The use of NSAIDs, including aspirin, may help prevent colon cancer. Inflammatory bowel disease confers a 4- to 20-fold increase in colorectal cancer risk, with younger age at diagnosis.

Special Notes

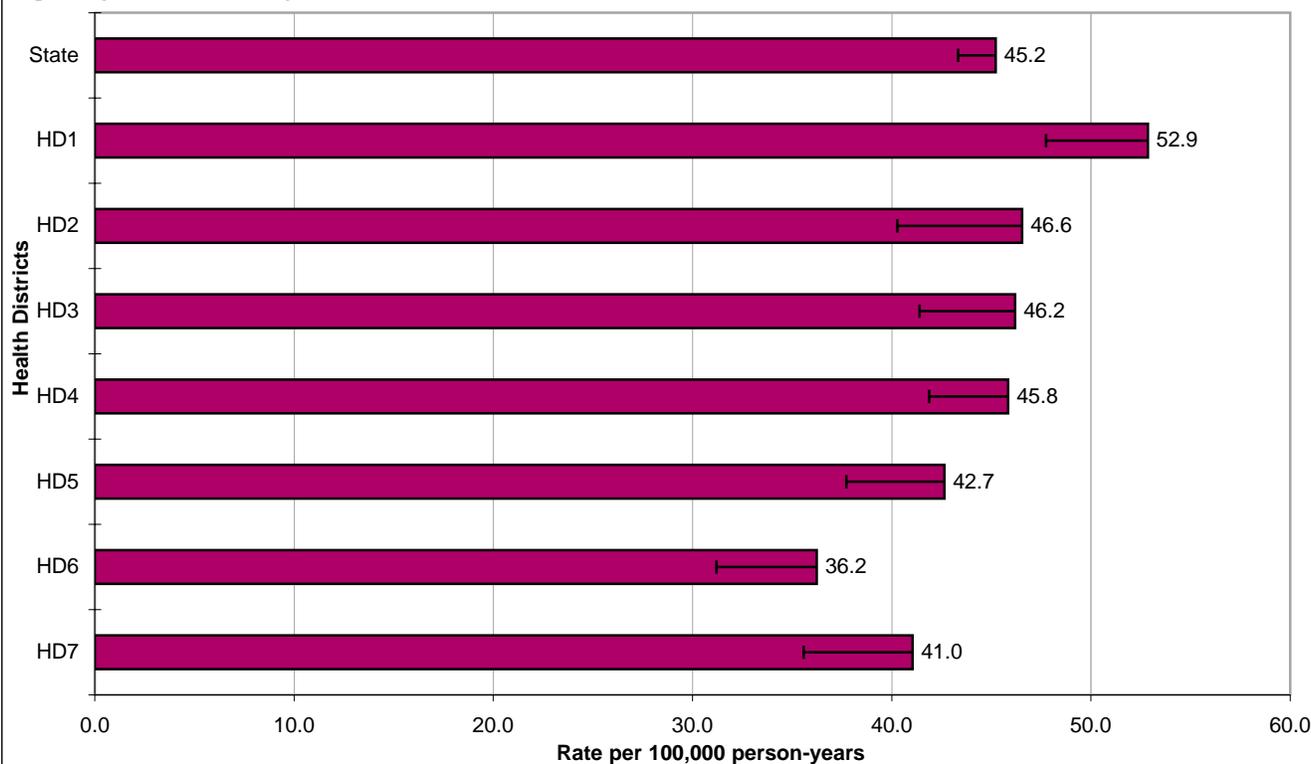

Mean age-adjusted incidence rate across health districts:	44.5
95% confidence interval on the mean age-adjusted incidence rate:	40.6 - 48.3
Median age-adjusted incidence rate of health districts:	45.8
Range of age-adjusted incidence rate for health districts:	36.2 - 52.9
SEER rate (2001, Whites):	51.1

Few cases of colorectal cancer were diagnosed in persons less than 30 years of age. There was a steep increase in age-specific incidence rates starting at age 55 and peaking in the age group 85+ for males and females. No health district had statistically significantly more, or fewer, cases than expected based upon rates for the remainder of Idaho.

Caribou	-	Lemhi	-		

Stage at Diagnosis - Endometrium

Risk and Associated Factors

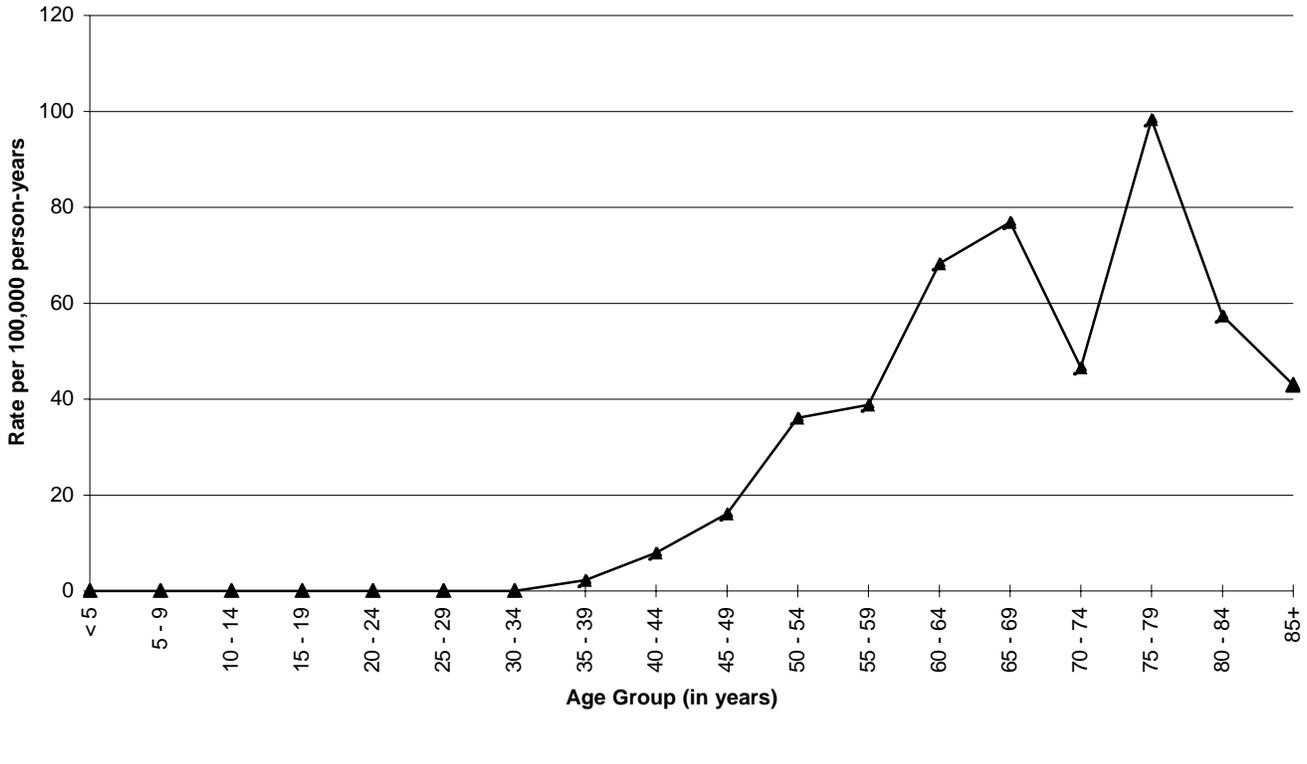

Age	Occurs predominantly after menopause, with median age 58 and peaking at the 65 to 75 age group.
Race & SES	Caucasian women have higher rates than African American or Asian women in the U.S.
Genetics	Familial tendency has been observed, but likely accounts for a small fraction of cases.
Diet	Dietary fat may play a role in increased risk. Obesity and hypertension are common associated conditions of endometrial cancer.
Hormonal	Factors that elevate levels of estrogen or decrease progesterone levels enhance the risk. Women who have never carried a pregnancy to term are at a relatively high risk. Risk decreases as the number of pregnancies increases. An increased incidence of endometrial cancer has been found in association with prolonged, unopposed estrogen exposure as well as with tamoxifen treatment of breast cancer. Use of combination oral contraceptives (estrogen and progestin) decreases risk of endometrial cancer by about 50%.

Special Notes

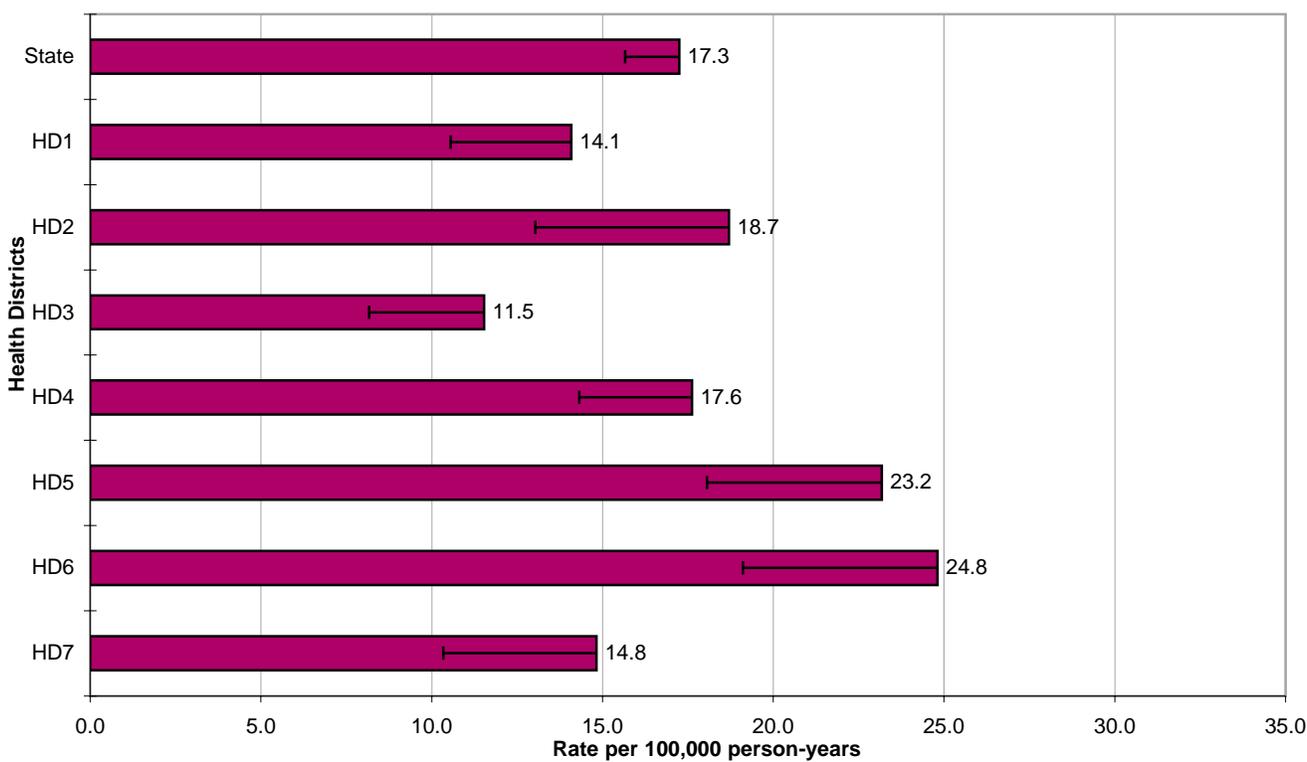

Mean age-adjusted incidence rate across health districts:	17.8
95% confidence interval on the mean age-adjusted incidence rate:	14.2 - 21.4
Median age-adjusted incidence rate of health districts:	17.6

Canyon	6	Latah	5	Washington	1
Caribou	-	Lemhi	3		

Stage at Diagnosis - Esophagus

Risk and Associated Factors

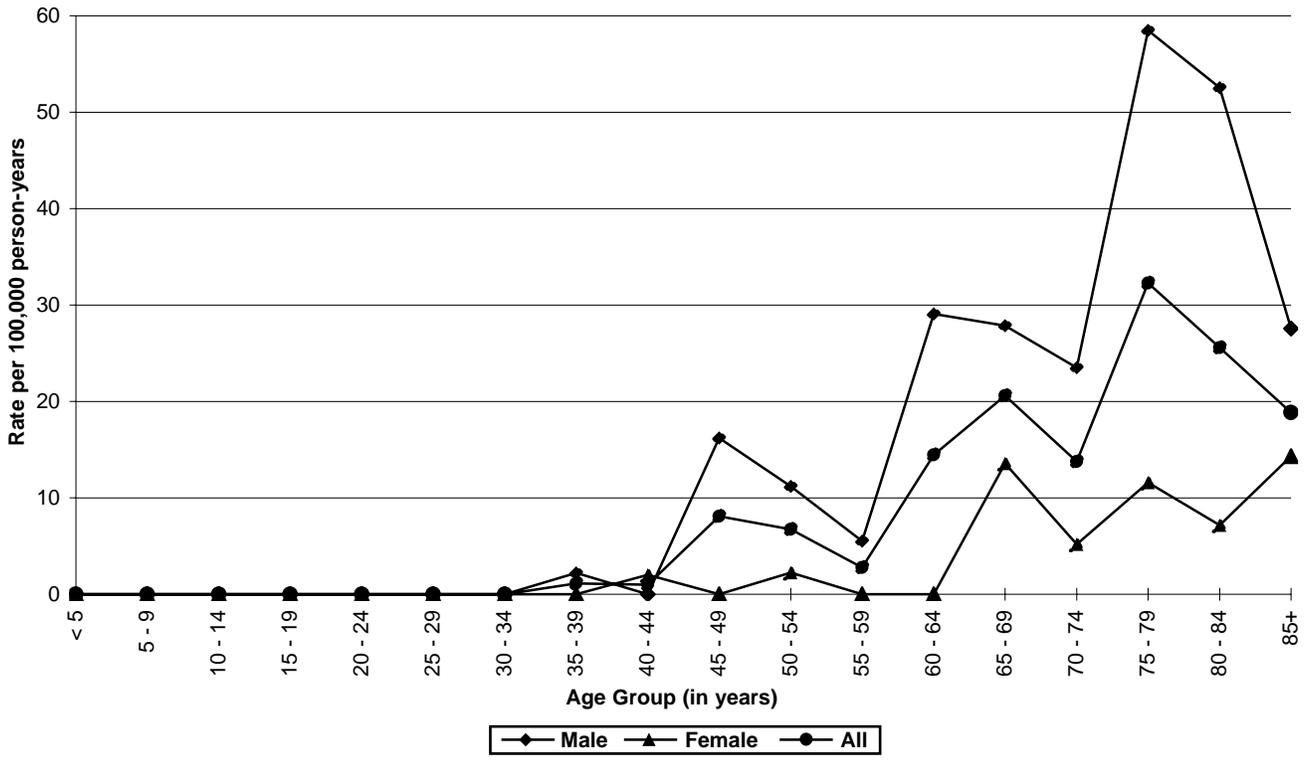

Age	Incidence of esophageal cancer is highest after age 55.
Gender	It is predominantly a disease of the male, with male-to-female ratios of about 3:1 or more.
Race & SES	United States data show that African Americans are affected more than Caucasians. Risk is higher among lower SES strata.
Occupation	Chimney sweeps exposed to soot are at higher risk.
Other	Tobacco use (cigarettes or spit tobacco) and heavy alcohol consumption are major risk factors for cancer of the esophagus. The risk is particularly increased when these two factors are both present. In Western Europe and North America, 90% or more of the risk of esophageal cancer can be attributed to alcohol and tobacco. Drinking "burning hot" beverages may increase the risk of esophageal cancer.

Special Notes

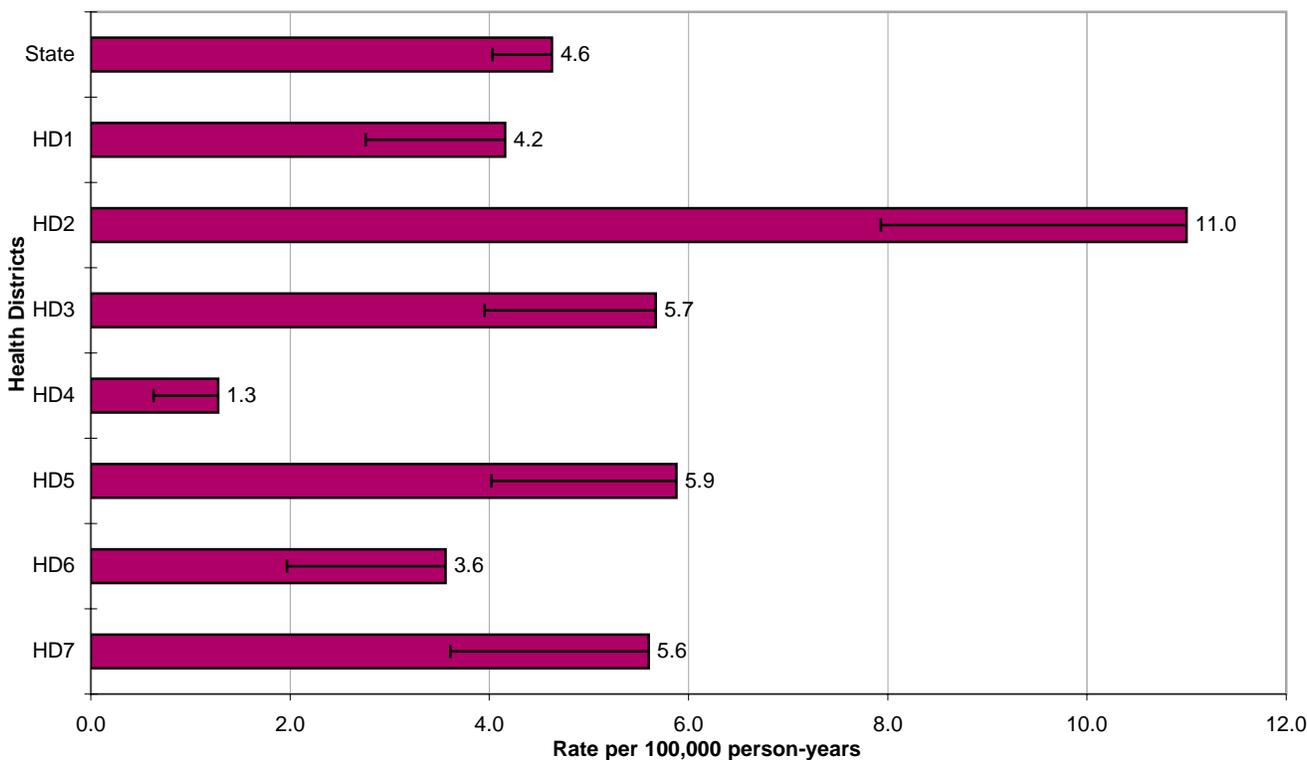

Mean age-adjusted incidence rate across health districts:	5.3
95% confidence interval on the mean age-adjusted incidence rate:	3.1 - 7.5
Median age-adjusted incidence rate of health districts:	5.6
Range of age-adjusted incidence rate for health districts:	1.3 - 11.0
SEER rate (2001, Whites):	4.7

No cases of esophageal cancer were diagnosed in person less than 35 years of age. The age-specific incidence rates peaked in the age group 75-79 for males and 85+ for females. Health District 2 had statistically significantly more cases than expected based upon rates for the remainder of Idaho ($p < 0.01$), and Health District 4 had significantly fewer cases than expected based upon rates for the remainder of Idaho ($p < 0.01$).

Butte	-	Jerome	-	Twin Falls	1
Camas	-	Kootenai	5	Valley	-
Canyon	8	Latah	2	Washington	-
Caribou	-	Lemhi	-		

Risk and Associated Factors

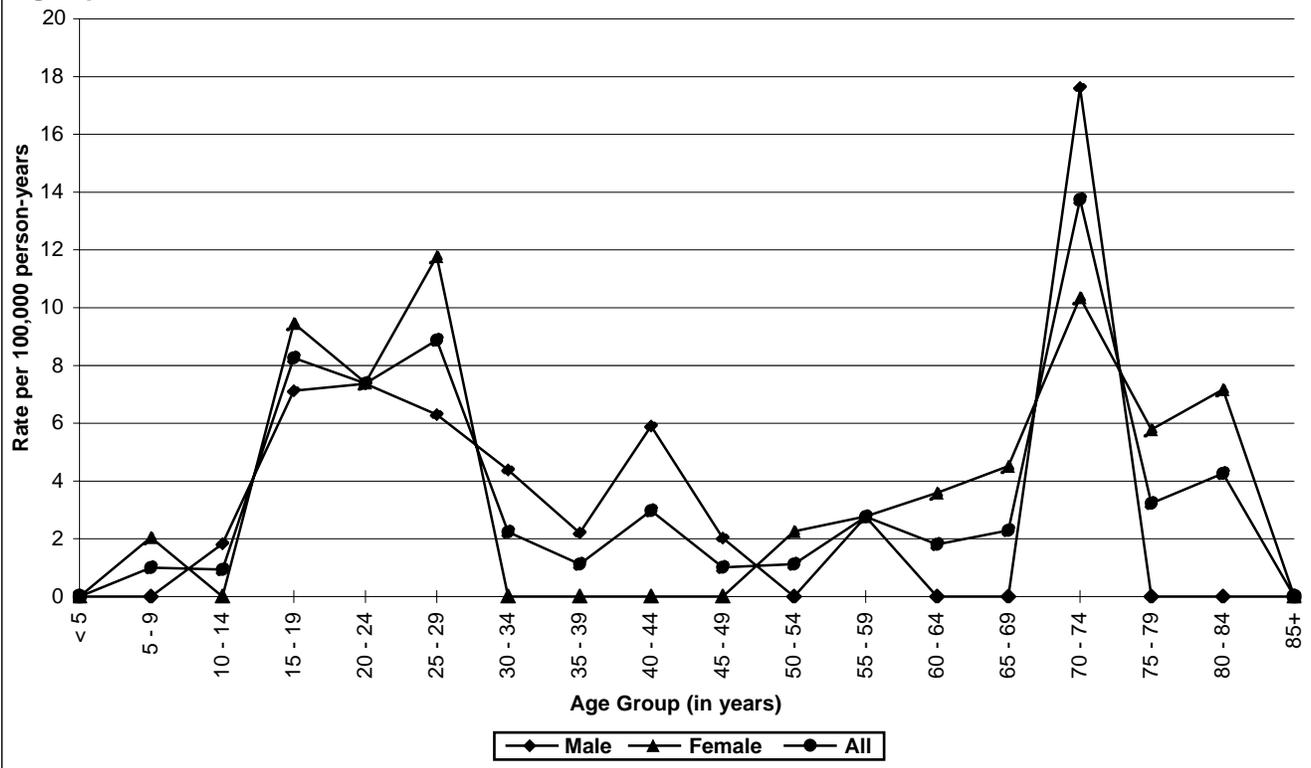

Age	High rates are seen in young adults and in later age groups especially among males.
Gender	Males have higher rates than females.
Race & SES	Hodgkin's lymphoma is more common among Caucasians than among African Americans. Hodgkin's lymphoma is more common in higher income groups.
Genetics	Genetic factors are thought to play an important role in the etiology of Hodgkin's lymphoma, but these are yet to be adequately defined.
Other	Small family size and ensuing delayed exposure to childhood infections is thought to be responsible for a portion of Hodgkin's lymphoma cases. Certain viral infections, especially Epstein-Barr virus, and AIDS increase the risk of Hodgkin's lymphoma. With current treatment, Hodgkin's disease, which was once highly fatal, is among the most curable of all cancers.

Special Notes

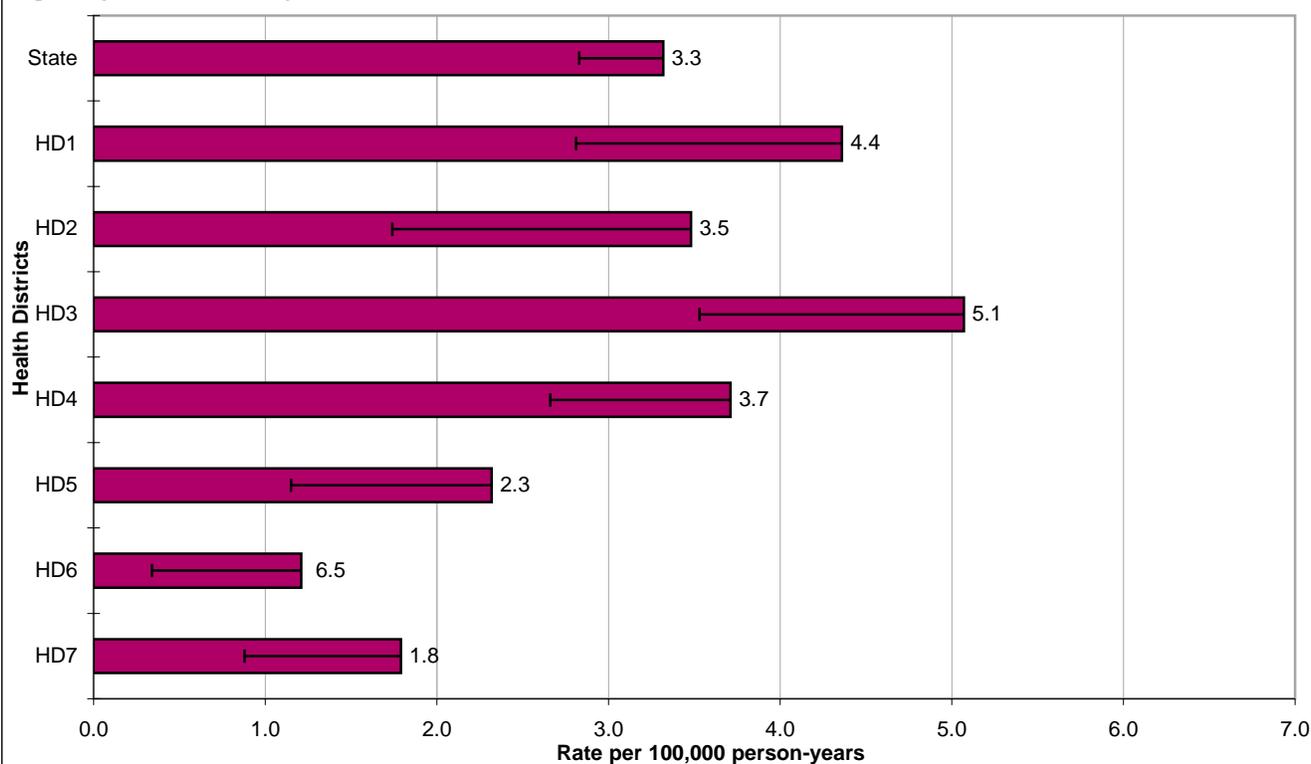

Mean age-adjusted incidence rate across health districts:	3.1
95% confidence interval on the mean age-adjusted incidence rate:	2.1 - 4.2
Median age-adjusted incidence rate of health districts:	3.5
Range of age-adjusted incidence rate for health districts:	1.2 - 5.1
SEER rate (2001, Whites):	2.7

The age-related incidence of Hodgkin's lymphoma is typically bimodal, usually with a peak in the late 20s to early 30s, and another peak in the ninth decade of life. This trend is difficult to discern in Idaho's population due to the relatively small number of cases observed annually, which increases the variability in age-specific rates. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Kidney

Risk and Associated Factors

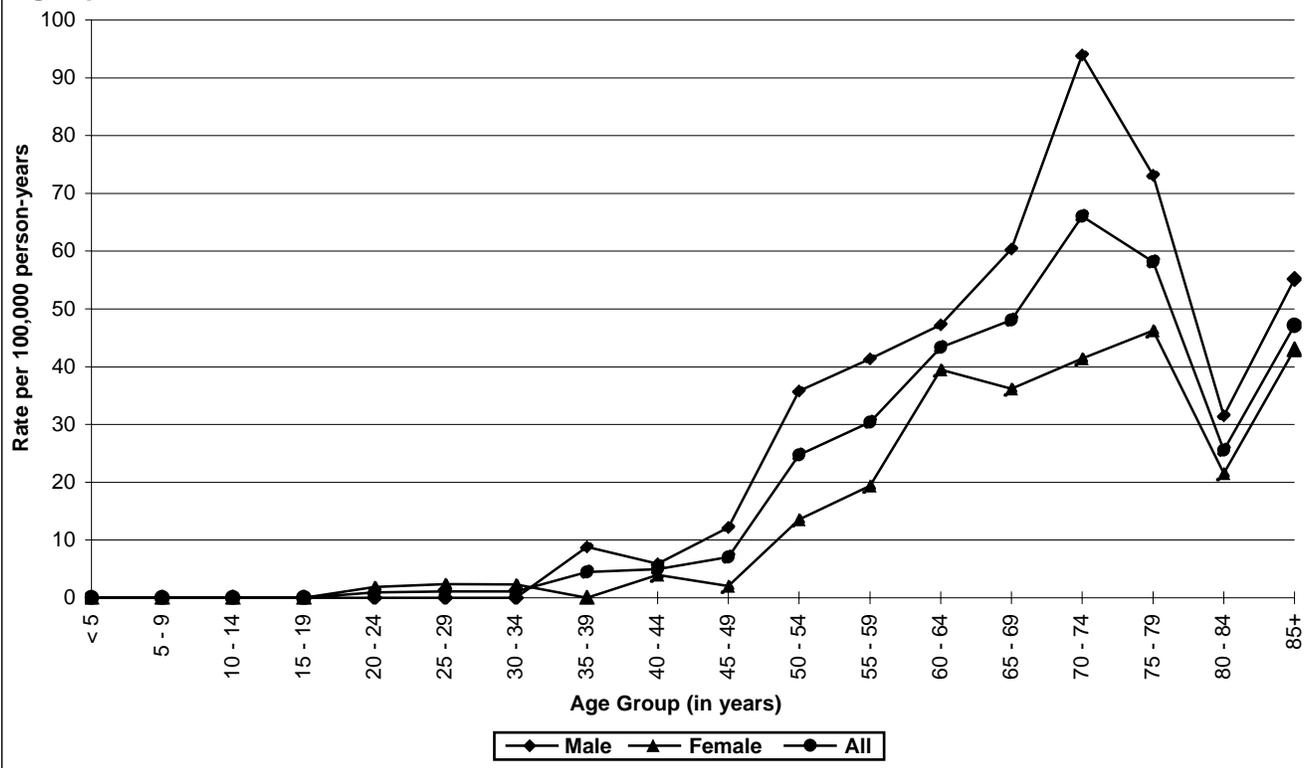

Age	Both adults and children are at risk for kidney cancer. Renal cell carcinoma accounts for 80% of all adult kidney cancers. Wilm's tumor (nephroblastoma) affects predominantly children under age 5 and accounts for the majority of childhood kidney cancers.
Gender	Renal cell carcinoma affects males twice as often as females.
Genetics	Wilm's tumor often occurs with congenital defects.
Occupation	Certain occupations, such as laundry and leather workers, have been associated with increased risk due to chemical exposure.
Other	Cigarette smoking is strongly associated with renal pelvis and ureter cancers. Smokers are at twice the risk of developing kidney cancer as non-smokers. Analgesic mixtures containing phenacetin increase the risk of kidney cancer. Obesity is a risk factor for kidney cancer. High dietary protein consumption, independent of fat and calorie intake, may elevate kidney cancer risk.

Special Notes

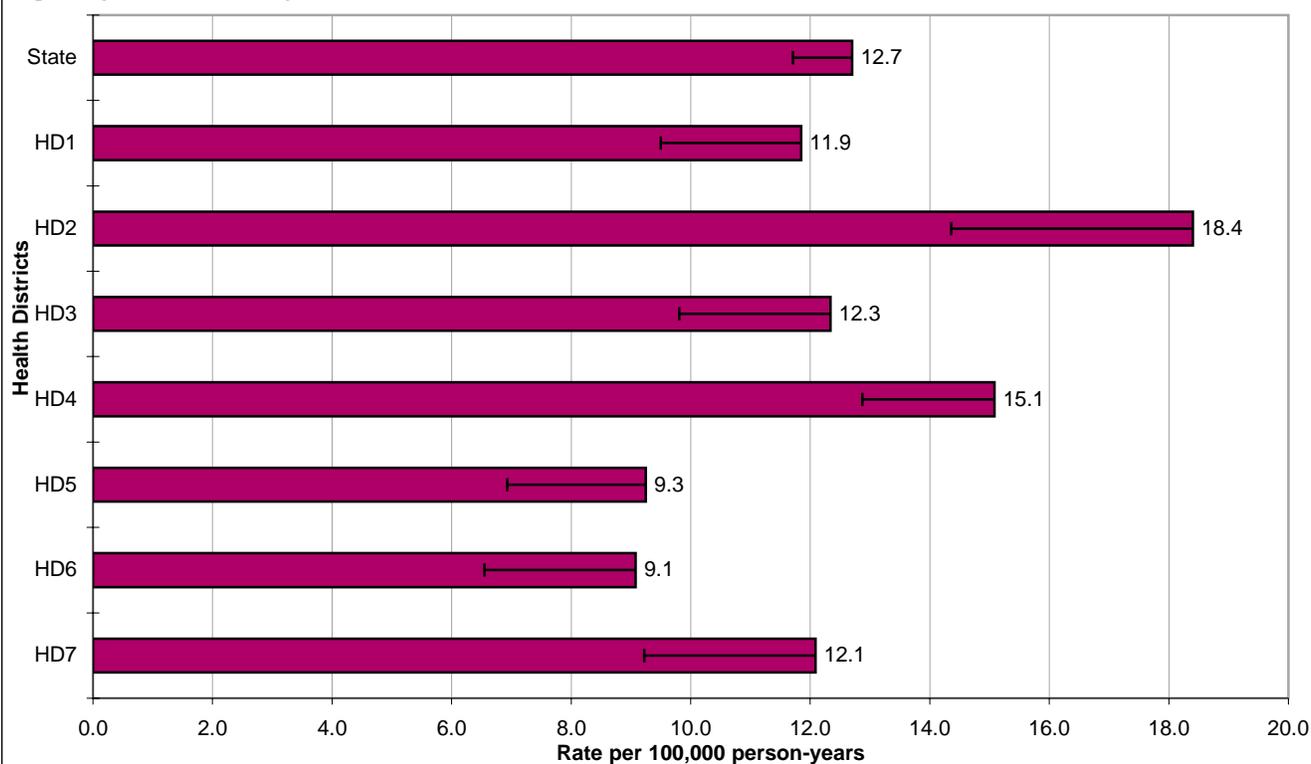

Mean age-adjusted incidence rate across health districts:	12.6
95% confidence interval on the mean age-adjusted incidence rate:	10.2 - 15.0
Median age-adjusted incidence rate of health districts:	12.1
Range of age-adjusted incidence rate for health districts:	9.1 - 18.4
SEER rate (2001, Whites):	12.2

There were few cases of kidney or renal pelvis cancer among persons aged less than 35 years. The highest incidence among males was in the age group 70-74. The highest incidence among females was in the age group 75-79. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Larynx

Risk and Associated Factors

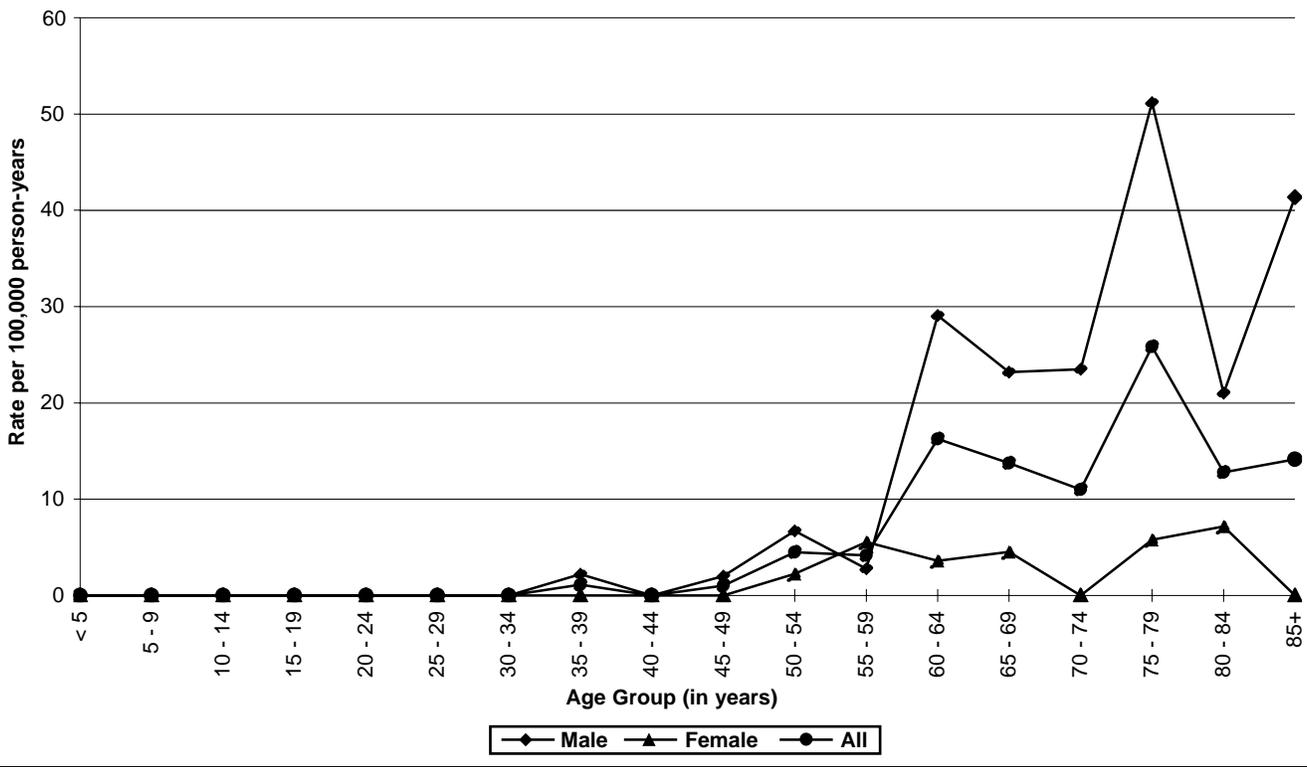

Age	Rates increase with age, with the vast majority of cases occurring after age 55.
Gender	Much more common in males than females.
Race & SES	Generally in the United States, African Americans have higher incidence rates than Caucasians. Lower income groups experience higher rates.
Occupation	Laryngeal cancer has been associated with exposures such as asbestos and wood dust.
Diet	Diets low in fresh fruits and vegetables may increase the risk.
Other	Cigarette smoking and alcohol use are both major risk factors. The combination of alcohol consumption and tobacco use (smoking or spit tobacco) acts greatly to increase the risk. A patient with a single laryngeal cancer who continues to smoke and drink alcohol has an enhanced risk of developing a second laryngeal tumor.

Special Notes

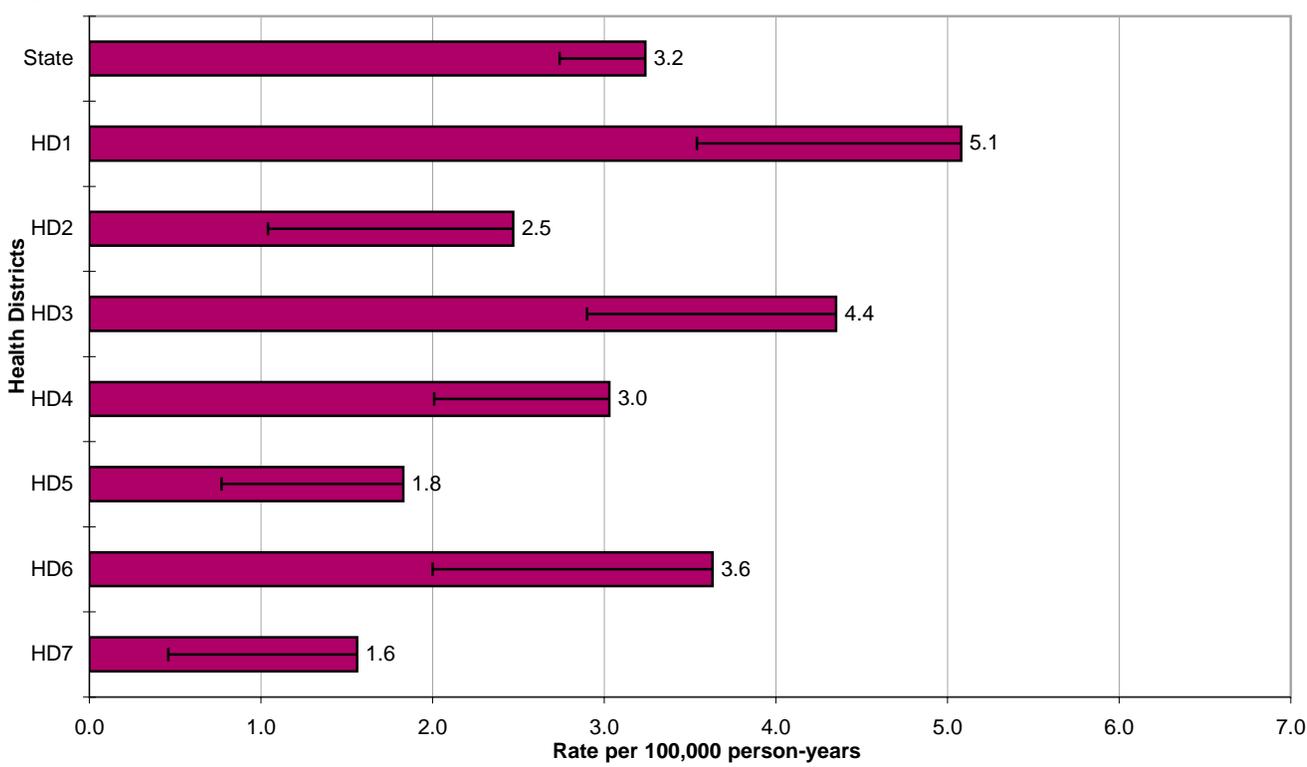

Mean age-adjusted incidence rate across health districts:	3.1
95% confidence interval on the mean age-adjusted incidence rate:	2.2 - 4.1
Median age-adjusted incidence rate of health districts:	3.0
Range of age-adjusted incidence rate for health districts:	1.6 - 5.1
SEER rate (2001, Whites):	3.5

There were no cases of laryngeal cancer among persons aged less than 35 years. The age-specific incidence rates for males were more than twice those for females in most age groups. The highest incidence rate among males was in the age group 75-79. The highest incidence rate among females was in the age group 80-84. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Caribou	4	Lemhi	1		

Stage at Diagnosis - Leukemia

Risk and Associated Factors

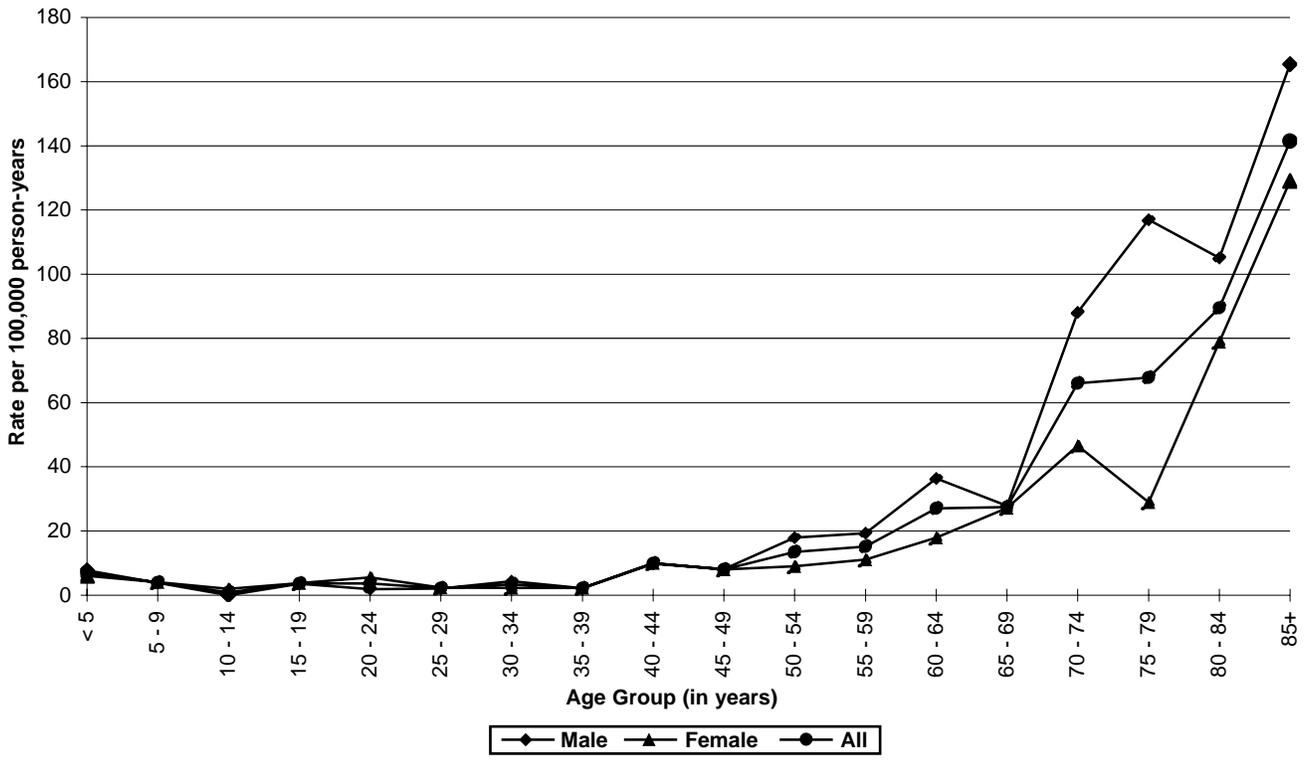

Age	This is the most common form of cancer in children. Incidence usually increases with age in adults. The highest rates occur in individuals over age 60.
Gender	Males have a higher incidence than females for chronic myelogenous leukemia (CML), acute lymphoblastic leukemia (ALL), and chronic lymphocytic leukemia (CLL).
Race	ALL is less common among African Americans. CLL is rare in Asians.
Genetics	Certain congenital defects, such as trisomy 21, Fanconi's anemia, Bloom syndrome, and ataxia-telangiectasia, increase risk in children for various types of leukemia.
Occupation	Benzene is a known cause of leukemia (predominantly acute myelogenous leukemia [AML]). Chimney sweeps exposed to soot are at higher risk.
Other	Ionizing radiation exposure increases the risk (except for CLL). Environmental exposure to low frequency, non-ionizing radiation and its association with leukemia incidence is being investigated. Treatment with some chemotherapeutic agents for other cancers increases the risk of leukemia. Exposure to herbicides used during the Vietnam War, including Agent Orange, has been associated with increased incidence of CLL. The antibiotic chloramphenicol likely causes leukemia. Autoimmune diseases and several viruses, including HTLV-I and EBV, have been linked to certain types of leukemia.

Special Notes

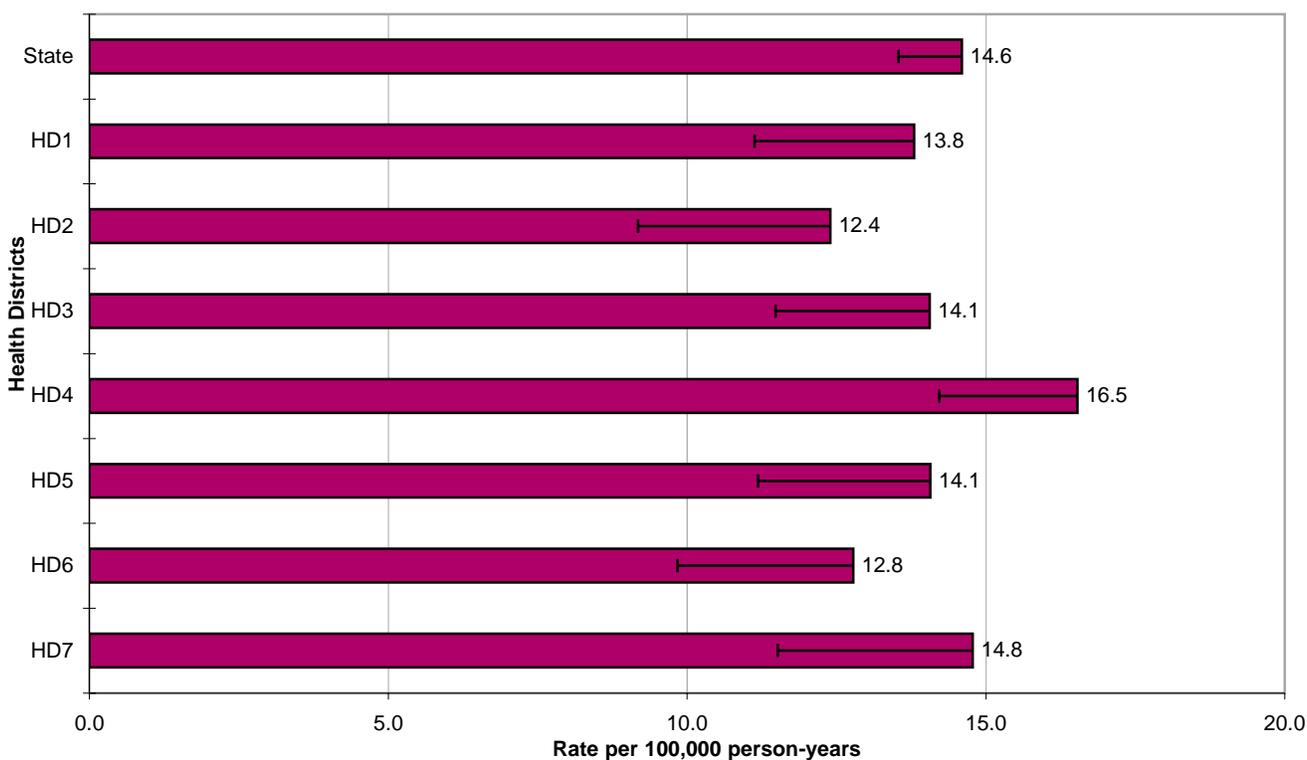

Mean age-adjusted incidence rate across health districts:	14.1
95% confidence interval on the mean age-adjusted incidence rate:	13.1 - 15.1
Median age-adjusted incidence rate of health districts:	14.1
Range of age-adjusted incidence rate for health districts:	12.4 - 16.5
SEER rate (2001, Whites):	12.8

The age-specific incidence distribution of leukemia for Idaho is quite similar to the typical pattern described by the SEER program of the National Cancer Institute. The rates are higher for males than females for all types of leukemia with the exception of acute myelogenous leukemia (AML), which has no predilection for age or sex. Generally, the incidence of leukemia is higher in older age groups. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Liver

Risk and Associated Factors

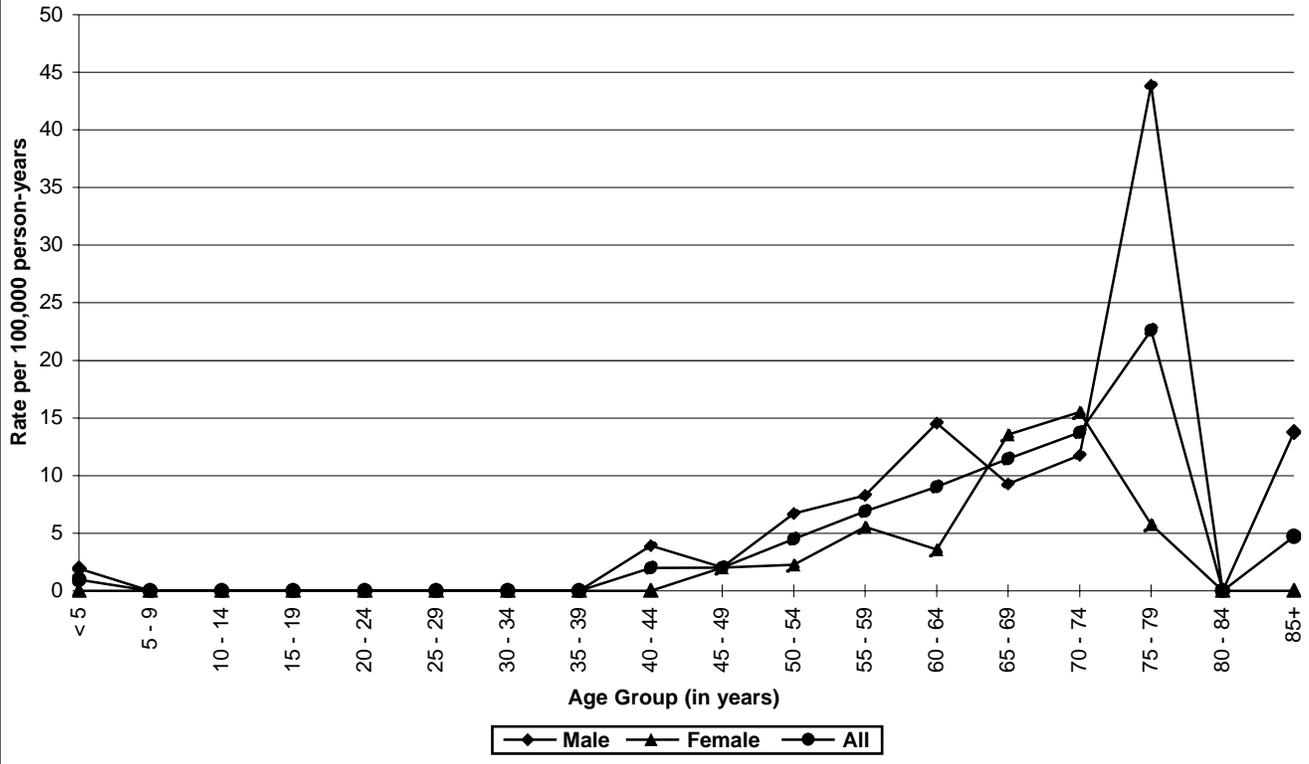

Age	The incidence rate of liver cancer increases with age.
Gender	Rates are usually higher in males than in females.
Race	Incidence is higher in Asians and African Americans than for the rest of the population.
Diet	Aflatoxins, which are present in certain foods such as peanut butter, are classified as a known human carcinogen, causing liver cancer.
Occupation	Thorium dioxide (an x-ray contrast medium) exposure increases liver cancer risk. Exposure to vinyl chloride used in plastic production is associated with an increased risk of angiosarcoma of the liver. Chimney sweeps exposed to soot are at higher risk.
Other	Hepatitis B and Hepatitis C infections are significant causes of hepatocellular carcinoma. Cirrhosis of the liver due to viral hepatitis, alcoholism, or toxic chemical exposure accounts for 50-80% of patients diagnosed with liver cancer. Long-term use of oral contraceptives increases risk of hepatocellular carcinoma.

Special Notes

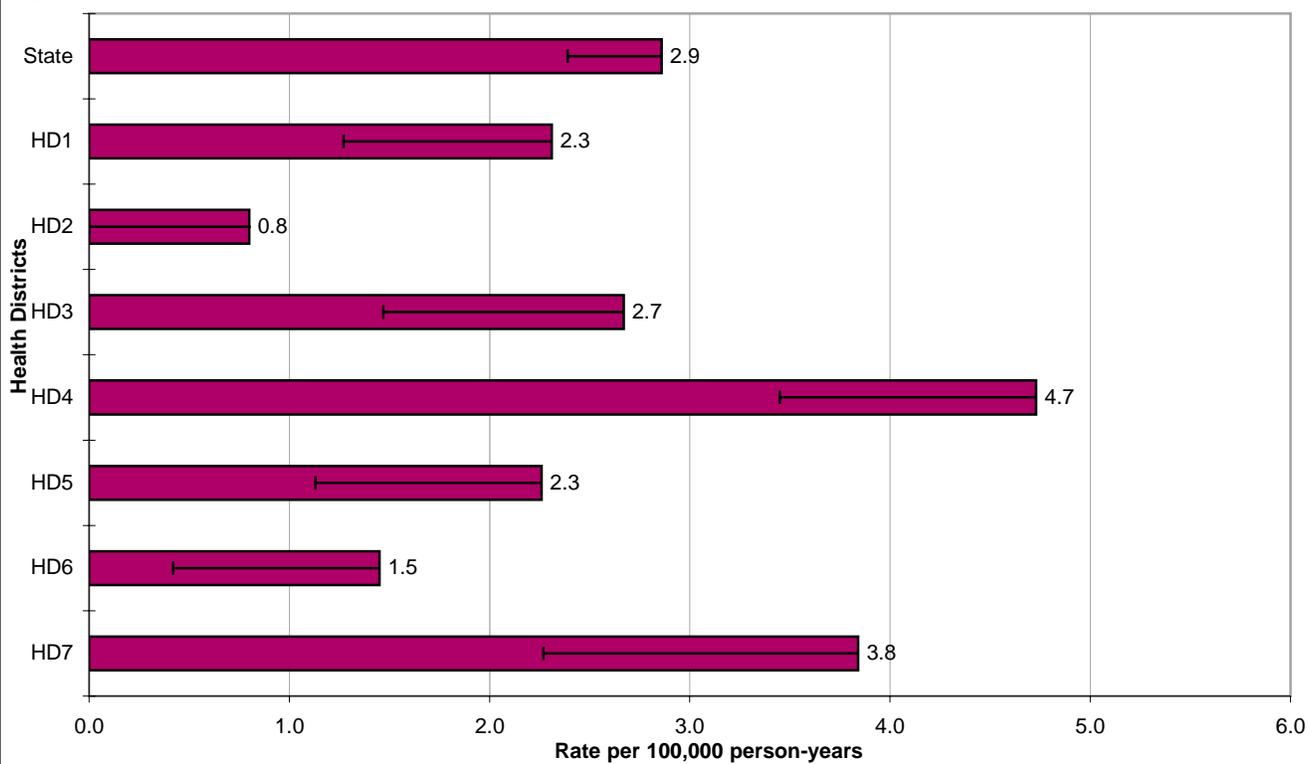

Mean age-adjusted incidence rate across health districts:	2.6
95% confidence interval on the mean age-adjusted incidence rate:	1.6 - 3.6
Median age-adjusted incidence rate of health districts:	2.3
Range of age-adjusted incidence rate for health districts:	0.8 - 4.7
SEER rate (2001, Whites):	4.0

There were few cases of liver cancer among persons less than 40 years of age. Age-specific incidence rates increased with age, peaking in the age group 75-79 for males and 70-74 for females. Health District 4 had statistically significantly more cases than expected based upon rates for the remainder of Idaho ($p < 0.05$).

Stage at Diagnosis - Lung and Bronchus

Risk and Associated Factors

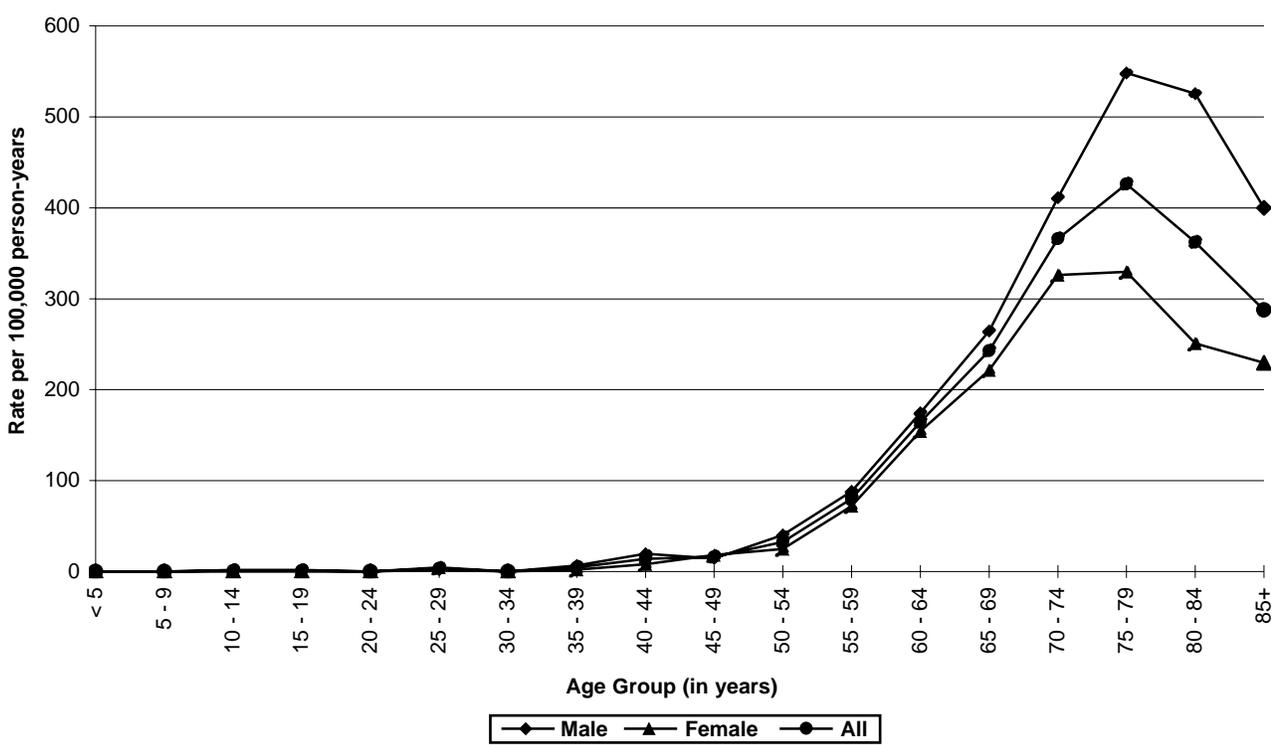

Age	Lung cancer incidence rates increase with age.
Gender	The incidence is currently higher in males than in females, but the gap is narrowing due to increased smoking rates in women.
Race & SES	Generally, incidence is higher among African Americans than other racial groups and is also higher in lower income groups.
Diet	Diets low in consumption of fresh fruits and vegetables contribute to increased risk.
Occupation	Occupational or environmental exposures to asbestos, cadmium, chromium, coal tars, crystalline silica dust, polycyclic aromatic hydrocarbons, radon, soot, chlorpyrifos insecticides, ionizing radiation, and other substances increase the risk.
Other	Cigarette smoking, including exposure to second-hand smoke, is the most important risk factor, accounting for over 85% of lung cancer deaths. Evidence exists that rates are about 1.3 times higher, adjusted for smoking, in urban areas than rural areas due to air pollution, mostly from motor vehicles.

Special Notes

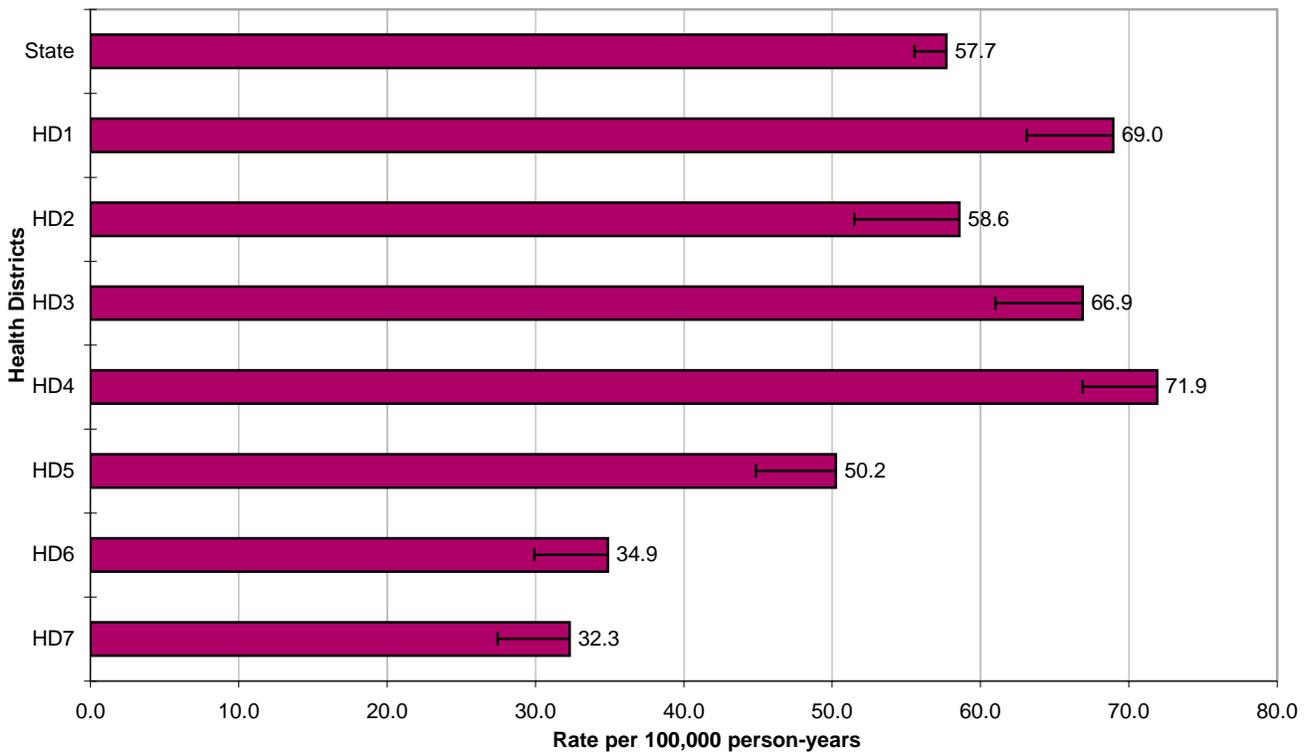

Mean age-adjusted incidence rate across health districts:	54.8
95% confidence interval on the mean age-adjusted incidence rate:	42.8 - 66.8
Median age-adjusted incidence rate of health districts:	58.6
Range of age-adjusted incidence rate for health districts:	32.3 - 71.9
SEER rate (2001, Whites):	62.1

There were few cases of lung cancer among persons less than 50 years of age. The age-specific incidence rates for males were uniformly higher than the rates for females after age 60. The incidence rates increased with age, peaking in the age group 75-79 for males and females. Health Districts 1 ($p < 0.05$) and 4 ($p < 0.01$) had statistically significantly more cases than expected based upon rates for the remainder of Idaho. Health Districts 6 ($p < 0.01$) and 7 ($p < 0.01$) had statistically significantly fewer cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Melanoma of Skin

Risk and Associated Factors

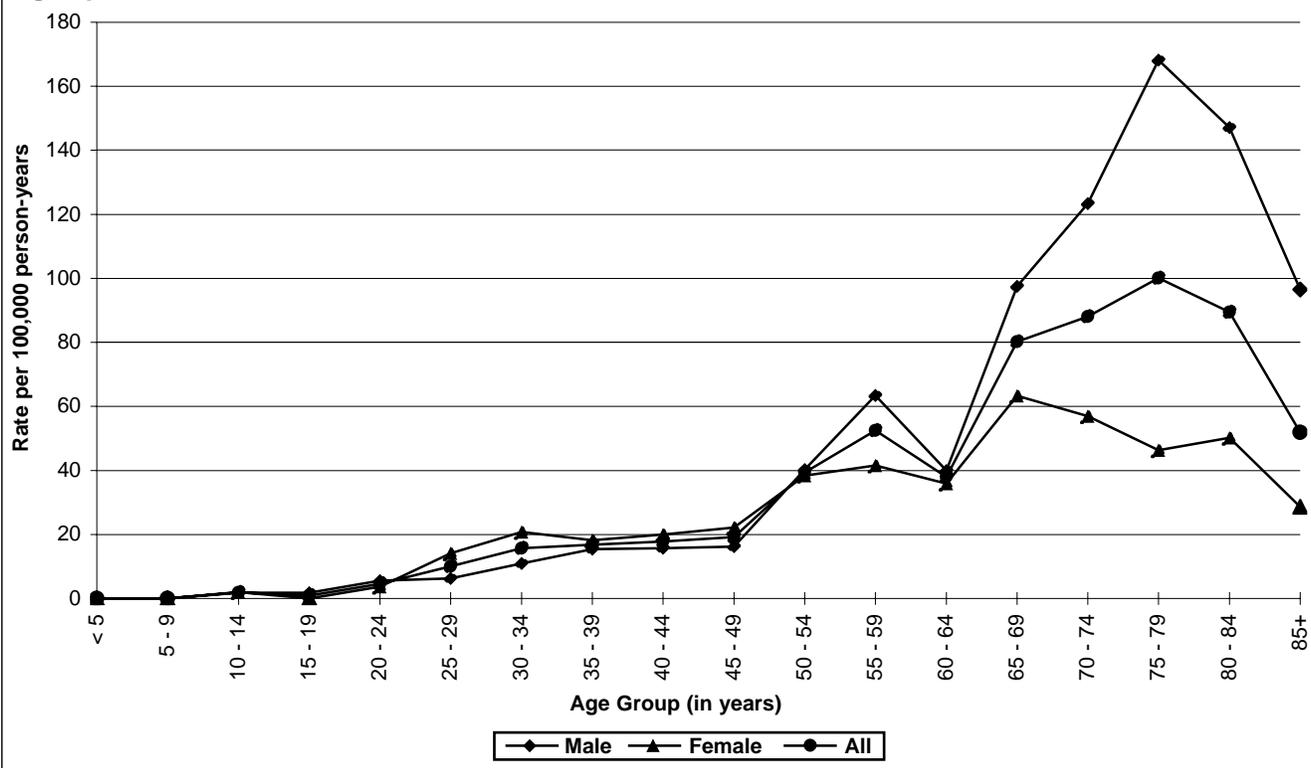

Age	Melanoma is extremely uncommon before puberty. Rates increase with age.
Gender	It occurs more frequently in males than females.
Race & SES	The incidence rate is highest in Caucasians and is uncommon in African Americans. It has an increased incidence in higher income groups (indoor workers).
Other	Ultra-violet light exposure, especially blistering sunburns during childhood, is a major risk factor. Melanoma incidence rates are increased around the world. Blue eyes, fair or red hair and pale complexion are well-known risk factors for melanoma. Apart from race and age, number of melanocytic nevi is the strongest known risk factor for melanoma. Intermittent exposure of untanned skin to intense sunlight is particularly effective in increasing incidence of melanoma.

Special Notes

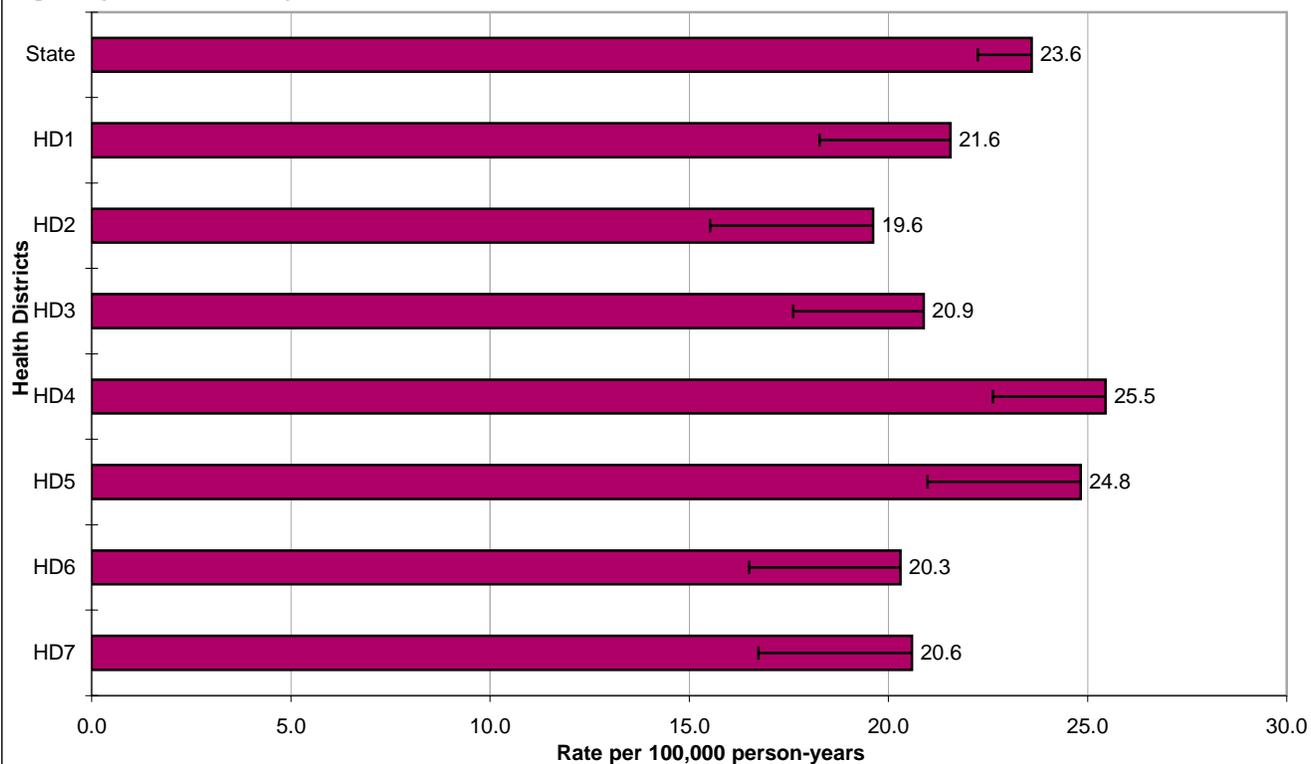

Mean age-adjusted incidence rate across health districts:	21.9
95% confidence interval on the mean age-adjusted incidence rate:	20.2 - 23.6
Median age-adjusted incidence rate of health districts:	20.9
Range of age-adjusted incidence rate for health districts:	19.6 - 25.5
SEER rate (2001, Whites):	22.6

There were few cases of melanoma of the skin among persons less than 25 years of age. The age-specific incidence rates were generally higher among males after age 50. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Myeloma

Risk and Associated Factors

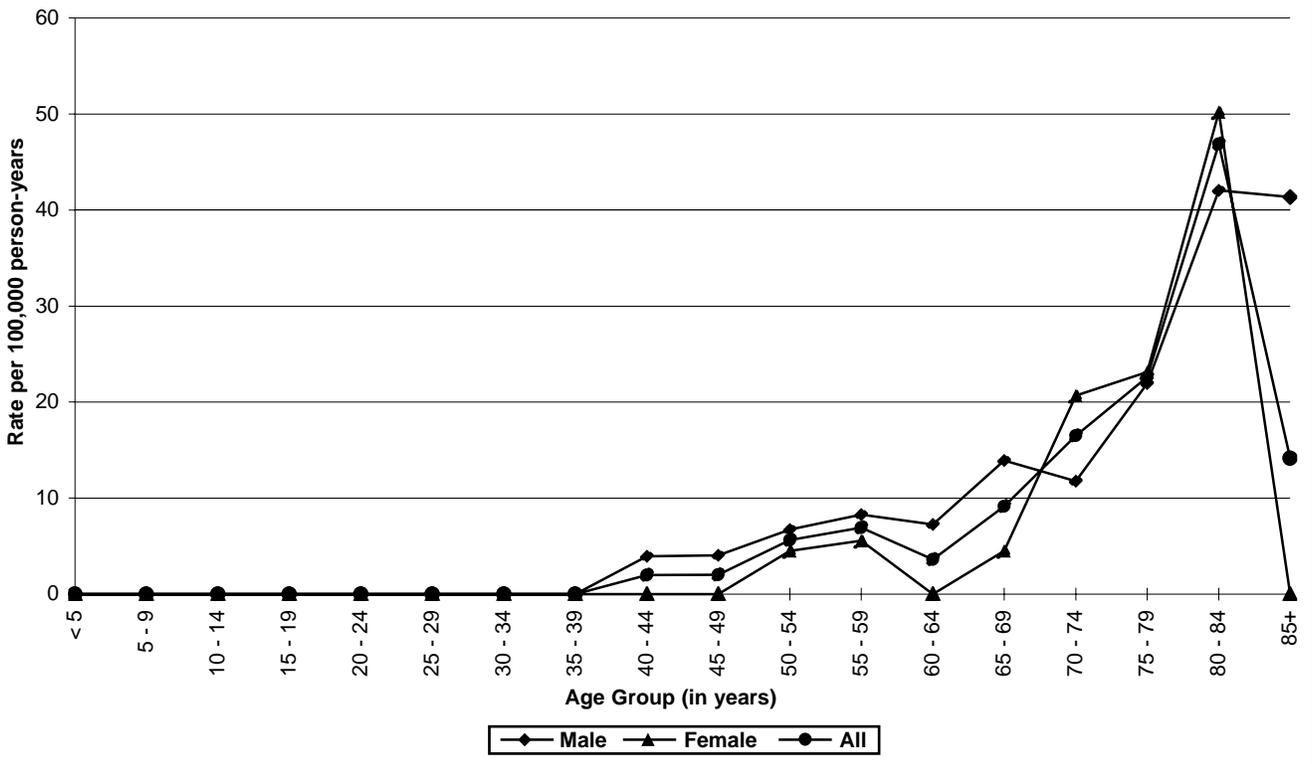

Age	Multiple myeloma is an age-dependent cancer. It increases with age and rarely occurs before age 40.
Gender	Rates for males are somewhat higher than for females.
Race	African Americans have a higher incidence rate, sometimes twice the rate for Caucasians.
Genetics	Genetic factors play an important role in its development but how so is not completely understood. Familial factors and chronic antigenic stimulation have also been implicated.
Other	Multiple myeloma has been associated with lymphomas such as Burkitt's, and non-Hodgkin's lymphomas. Studies have suggested several possible viral etiologies, and multiple myeloma has been linked to ionizing radiation exposure. Several specific chemical and physical substances have been linked to myeloma risk in one or more studies. Truck drivers, painters, and agricultural workers are at increased risk of multiple myeloma. Individuals with monoclonal gammopathy of unknown significance are predisposed to develop multiple myeloma.

Special Notes

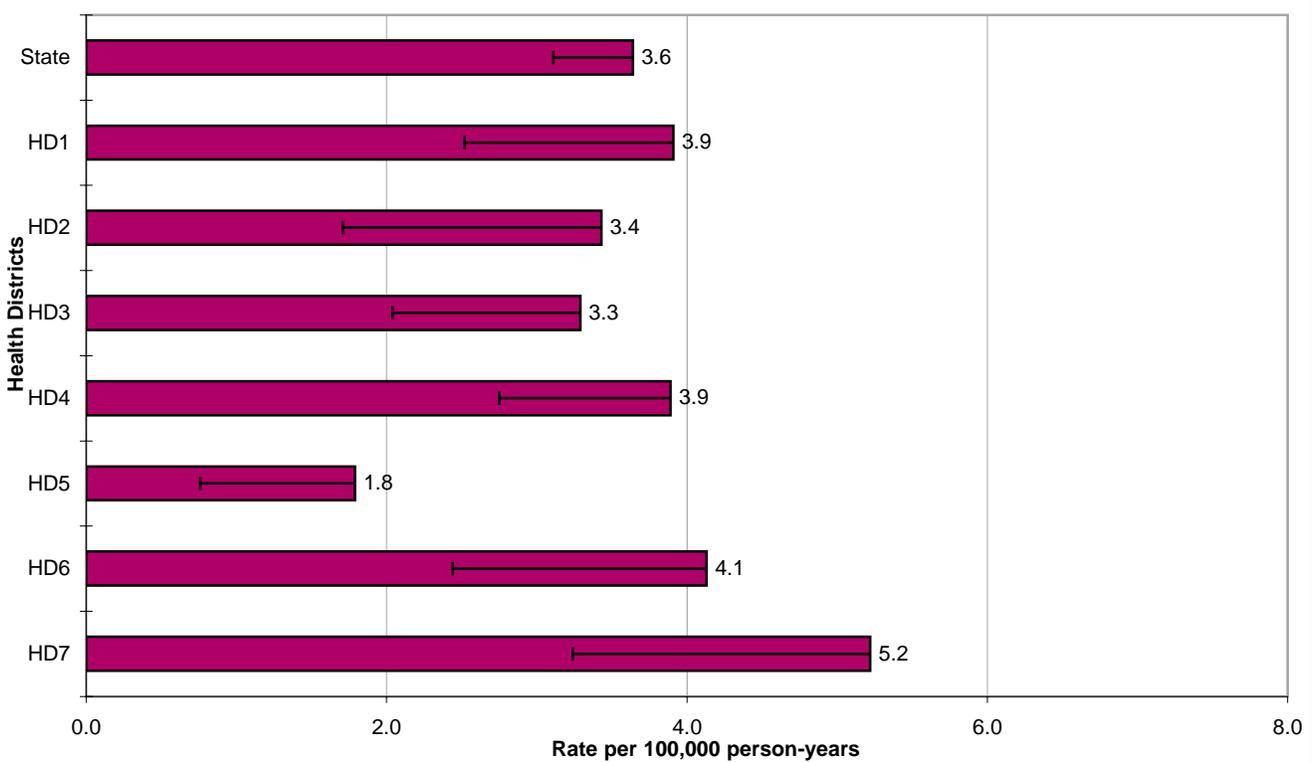

Mean age-adjusted incidence rate across health districts:	3.7
95% confidence interval on the mean age-adjusted incidence rate:	2.9 - 4.4
Median age-adjusted incidence rate of health districts:	3.9
Range of age-adjusted incidence rate for health districts:	1.8 - 5.2
SEER rate (2001, Whites):	5.0

There were few cases of plasma cell tumors among persons less than 45 years of age. The age-specific incidence rates increased rapidly for both males and females after age group 60-64. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Butte	2	Jerome	-	Twin Falls	16
Camas	-	Kootenai	20	Valley	1
Canyon	23	Latah	3	Washington	2
Caribou	-	Lemhi	1		

Risk and Associated Factors

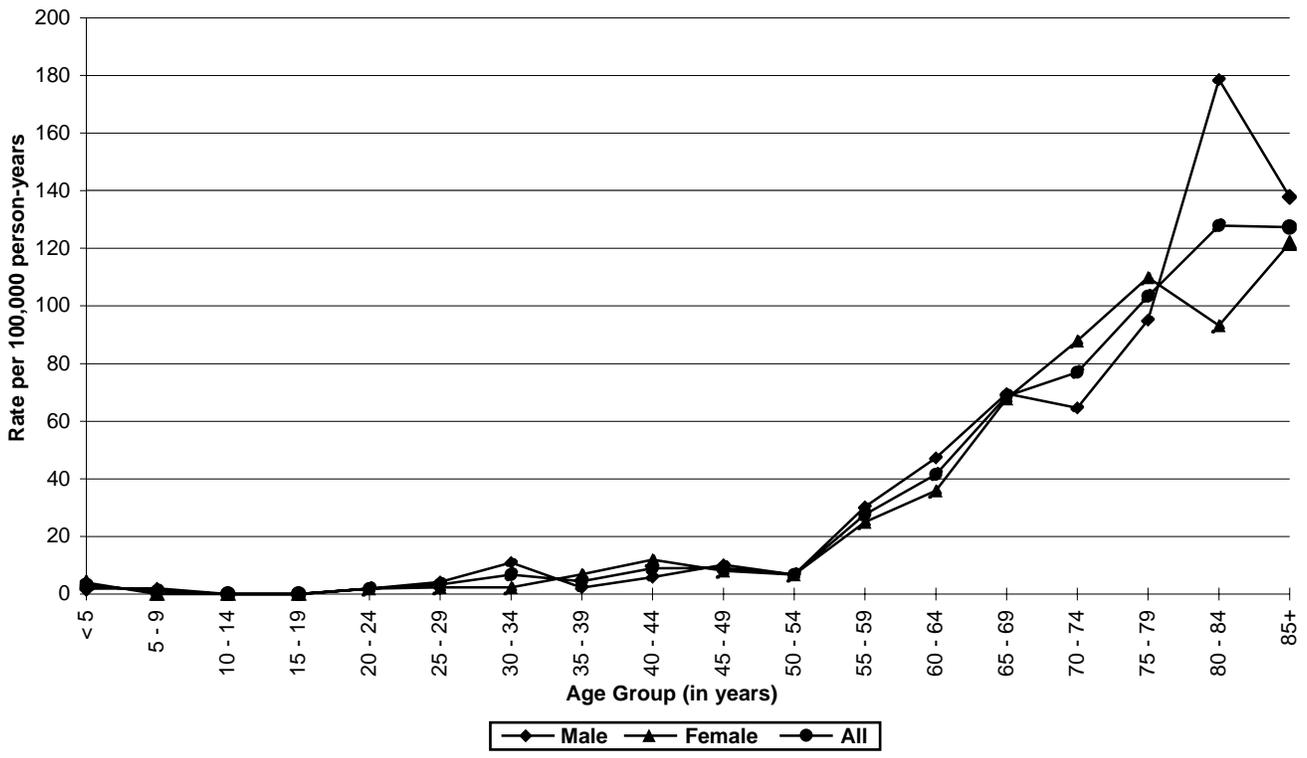

Age	Rates increase with age reaching the highest levels in the eighth and ninth decades of life.
Gender	Males have higher rates than females.
Race & SES	Generally in the United States incidence rates are higher for Caucasians than African Americans. Rates are higher in upper income groups.
Occupation	Ethylene oxide exposure at plants producing sterilized medical supplies and spices is a risk factor.
Other	Non-Hodgkin's lymphoma (NHL) develops with increased frequency in individuals infected with certain viruses, including HTLV-I, HIV, and EBV. Exposures to agricultural chemicals and PCBs have also been implicated. Treatment with some immunosuppressants increases the risk of NHL among organ transplant patients, evidently by reactivating Epstein-Barr virus.

Special Notes

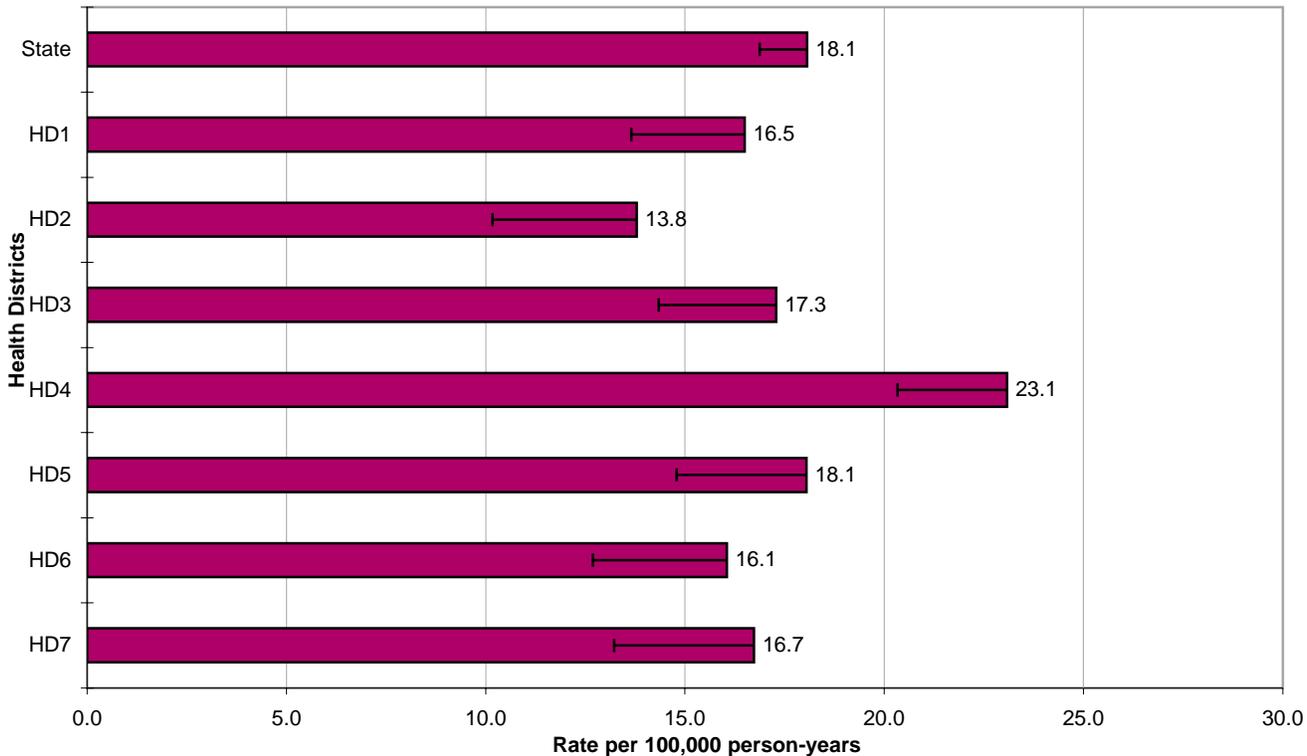

Mean age-adjusted incidence rate across health districts:	17.4
95% confidence interval on the mean age-adjusted incidence rate:	15.2 - 19.5
Median age-adjusted incidence rate of health districts:	16.7
Range of age-adjusted incidence rate for health districts:	13.8 - 23.1
SEER rate (2001, Whites):	19.7

The age-specific incidence rates of non-Hodgkin's lymphoma increased with age, peaking in the age group 80-84 for males and 85+ for females. Health District 4 ($p < 0.01$) had statistically significantly more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Oral Cavity

Risk and Associated Factors

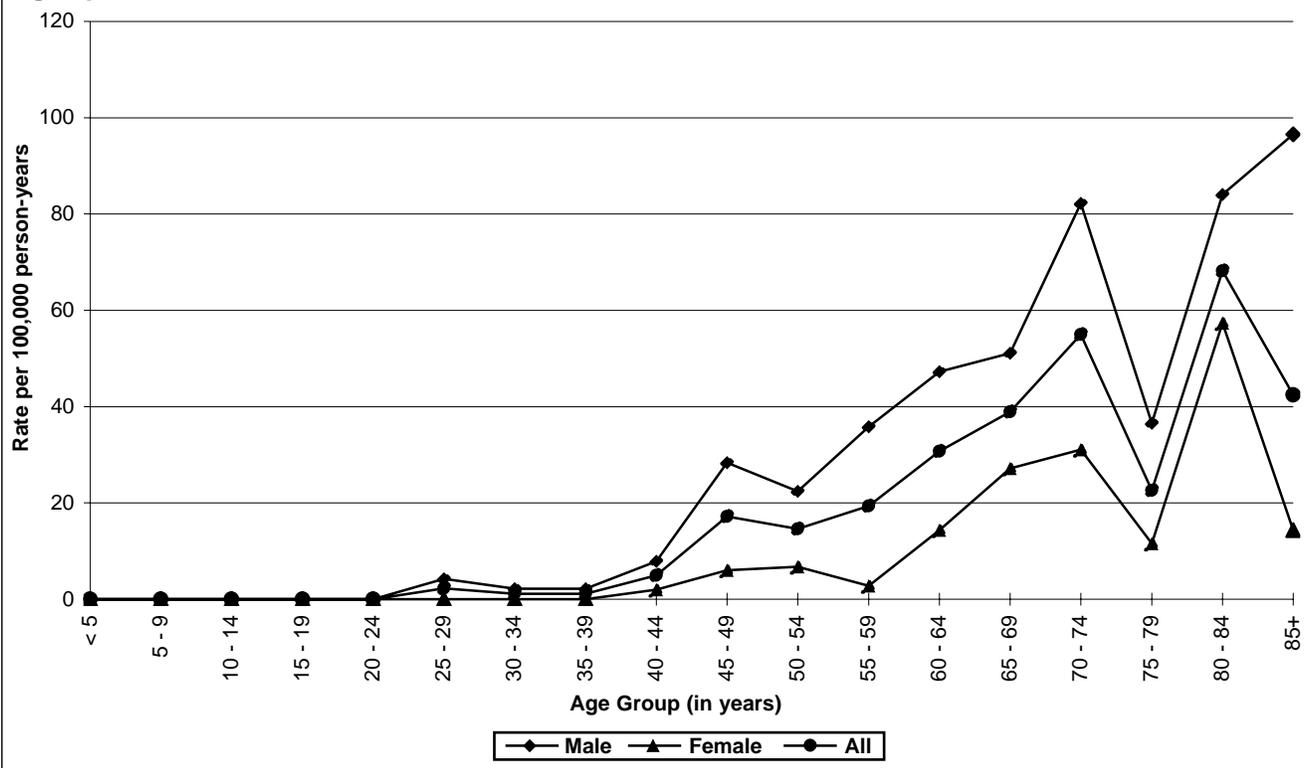

- Age** Most cases occur in people over age 60.
- Gender** Males have a higher incidence than females, 2-6x higher in most parts of the world.
- Race & SES** Rates are higher for African Americans than for Caucasians. Rates are also higher among lower income groups.
- Diet** Increased risk is associated with diets low in fresh fruit and vegetable consumption.
- Other** Smoking and spit tobacco are major risk factors for cancers of the oral cavity and pharynx. Alcohol use, especially excessive, is a major risk factor. Combined exposure to tobacco and alcohol multiply the risks of each other. It is estimated that smoking and drinking account for 75% of all oral cancers in the United States.

Special Notes

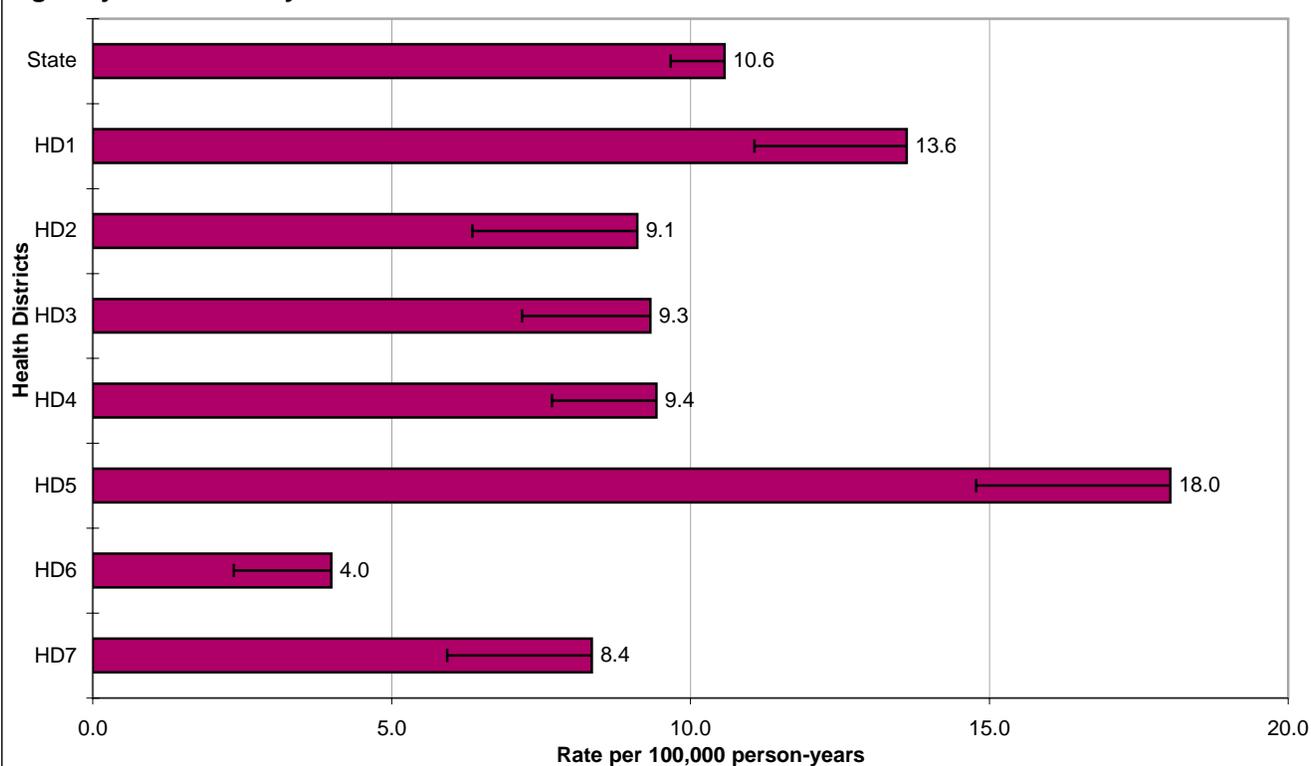

Mean age-adjusted incidence rate across health districts:	10.3
95% confidence interval on the mean age-adjusted incidence rate:	7.0 - 13.5
Median age-adjusted incidence rate of health districts:	9.3

Stage at Diagnosis - Ovary

Risk and Associated Factors

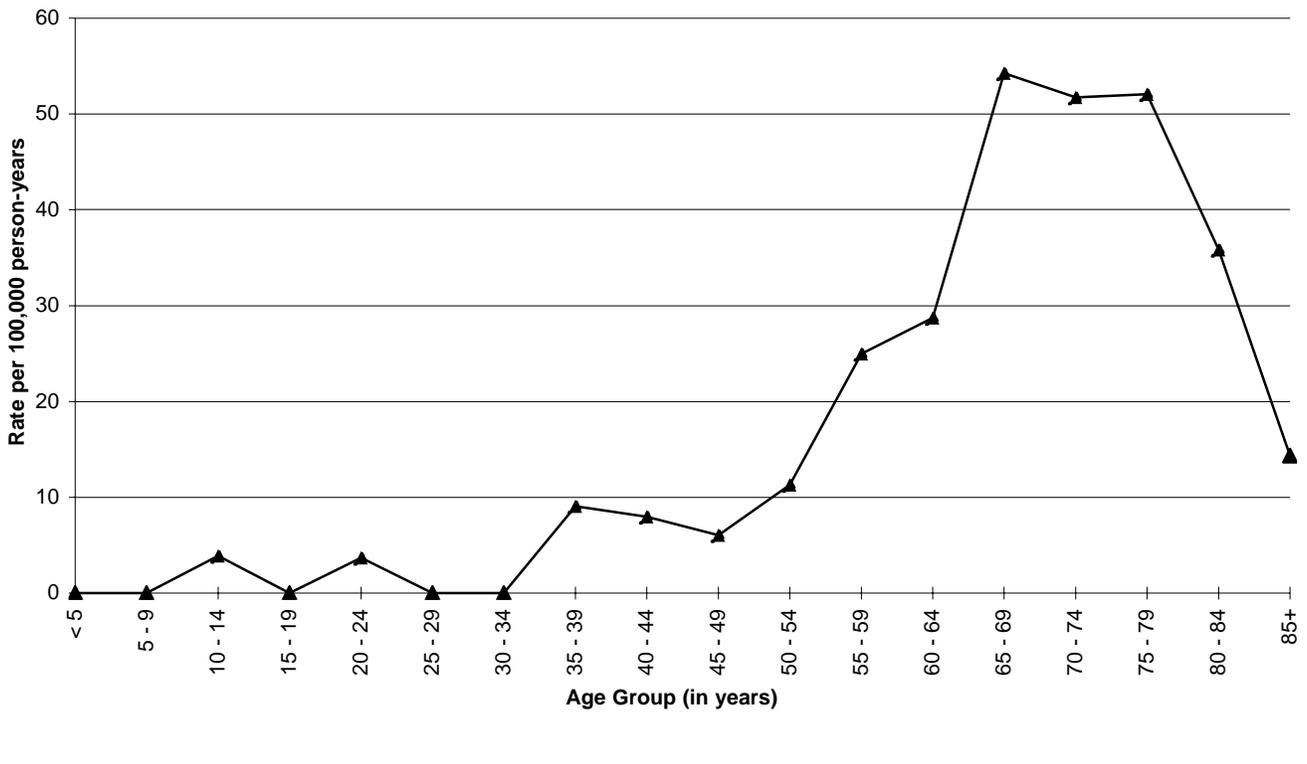

Age	The rate of ovarian cancer increases with age and it is primarily a disease of older women.
Race & SES	Rates are slightly higher in Caucasian females than in African American females. The rate is higher among upper income groups.
Genetics	The most important risk factor for ovarian cancer is a family history of a first-degree relative (mother, daughter, or sister) with the disease. The risk is higher still in women with two or more first-degree relatives with ovarian cancer.
Hormonal	Risk of ovarian cancer is significantly reduced via suppression of ovulation through pregnancy or oral contraceptive use. Highest risk is in post-menopausal women. It is also associated with a personal history of breast, endometrial, and colon cancers.
Diet	Dietary animal fat may increase the risk.
Other	High dose (>100 rads) ionizing radiation roughly doubles the risk of ovarian cancer.

Special Notes

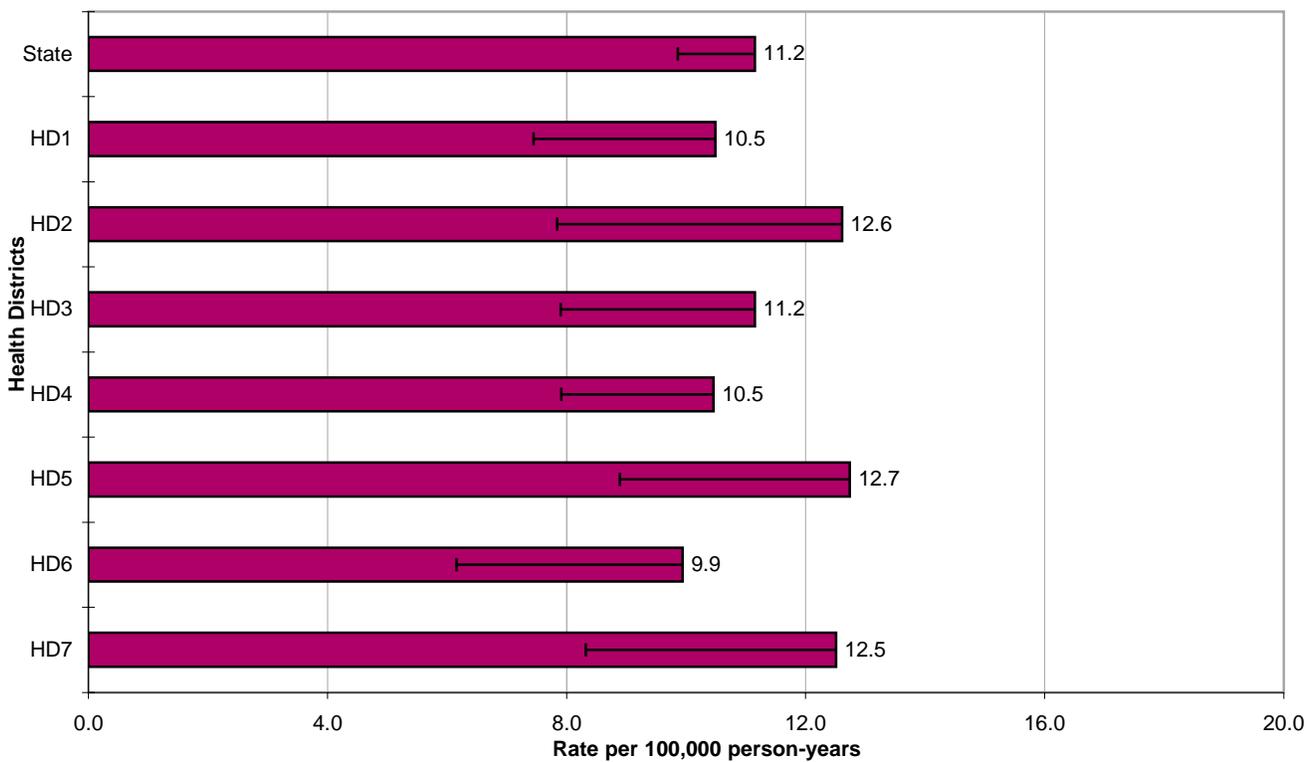

Mean age-adjusted incidence rate across health districts:	11.4
95% confidence interval on the mean age-adjusted incidence rate:	10.5 - 12.3
Median age-adjusted incidence rate of health districts:	11.2
Range of age-adjusted incidence rate for health districts:	9.9 - 12.7
SEER rate (2001, Whites):	14.9

There were few cases of ovarian cancer among persons aged less than 35 years. The age-specific incidence rates of ovarian cancer increased with age starting in the 45-49 age group. The highest age-specific rate was for women aged 65-69. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Pancreas

Risk and Associated Factors

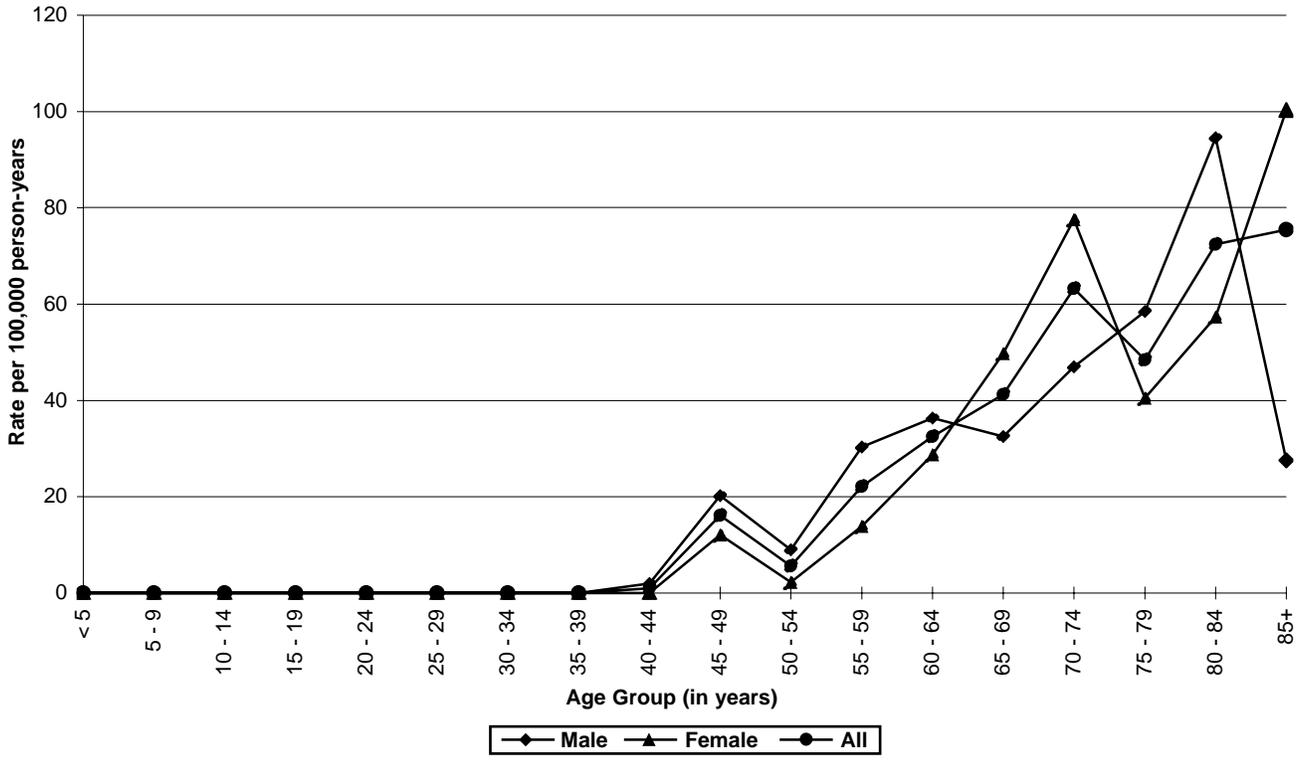

Age	Rates increase with age. It is rare in people younger than 40 years old.
Gender	Incidence is about 50% higher in males.
Race	In the United States, the incidence is higher in African Americans.
Diet	Investigators have generally found increased risks associated with animal protein and fat consumption, and decreased risks associated with vegetables and fruit intake.
Occupation	Persons in certain occupations are believed to be at higher risk, such as chemists, metal workers, and persons employed in the manufacture of benzidine and betanaphthylene.
Other	Pancreatic cancer is more common among smokers than non-smokers. Familial clustering has been observed in some studies. Pancreatic cancer usually progresses to an advanced stage before symptoms develop. It is rapidly fatal in over 90% of cases.

Special Notes

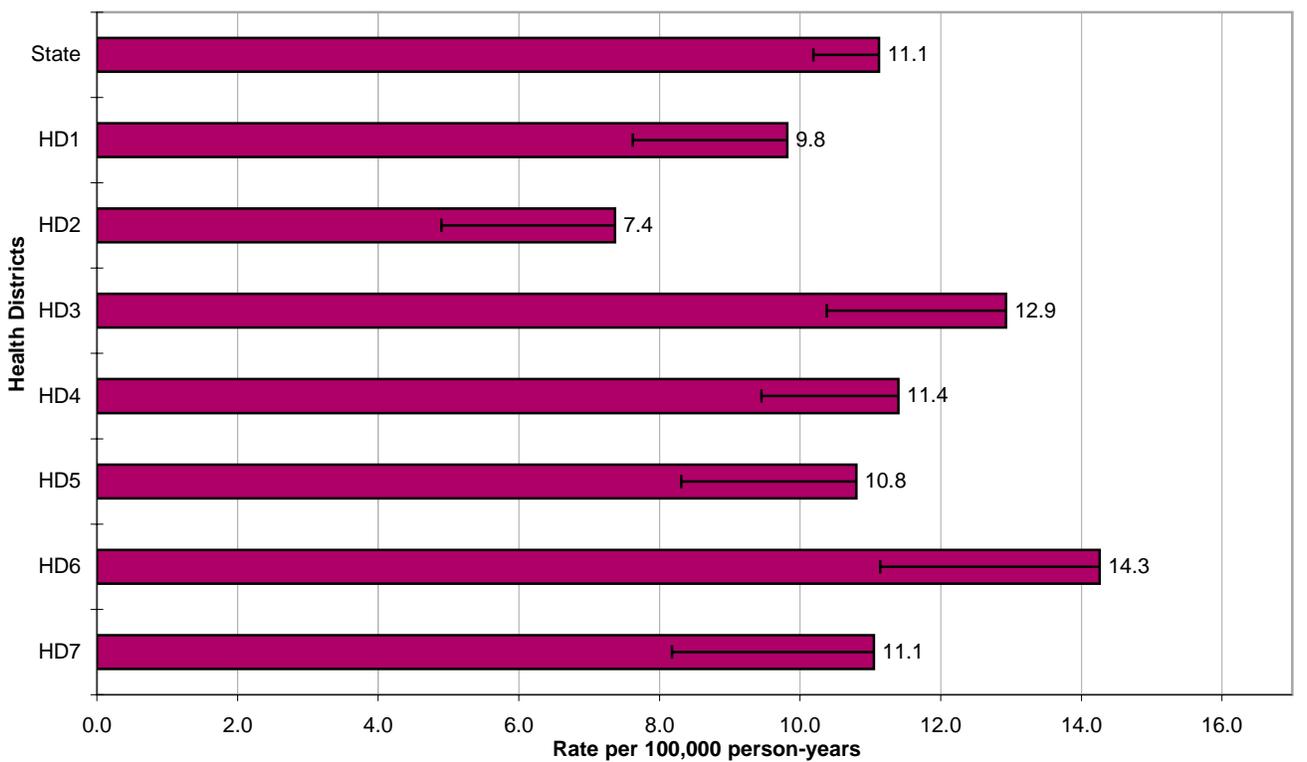

Mean age-adjusted incidence rate across health districts:	11.1
95% confidence interval on the mean age-adjusted incidence rate:	9.5 - 12.7

Stage at Diagnosis - Prostate

Risk and Associated Factors

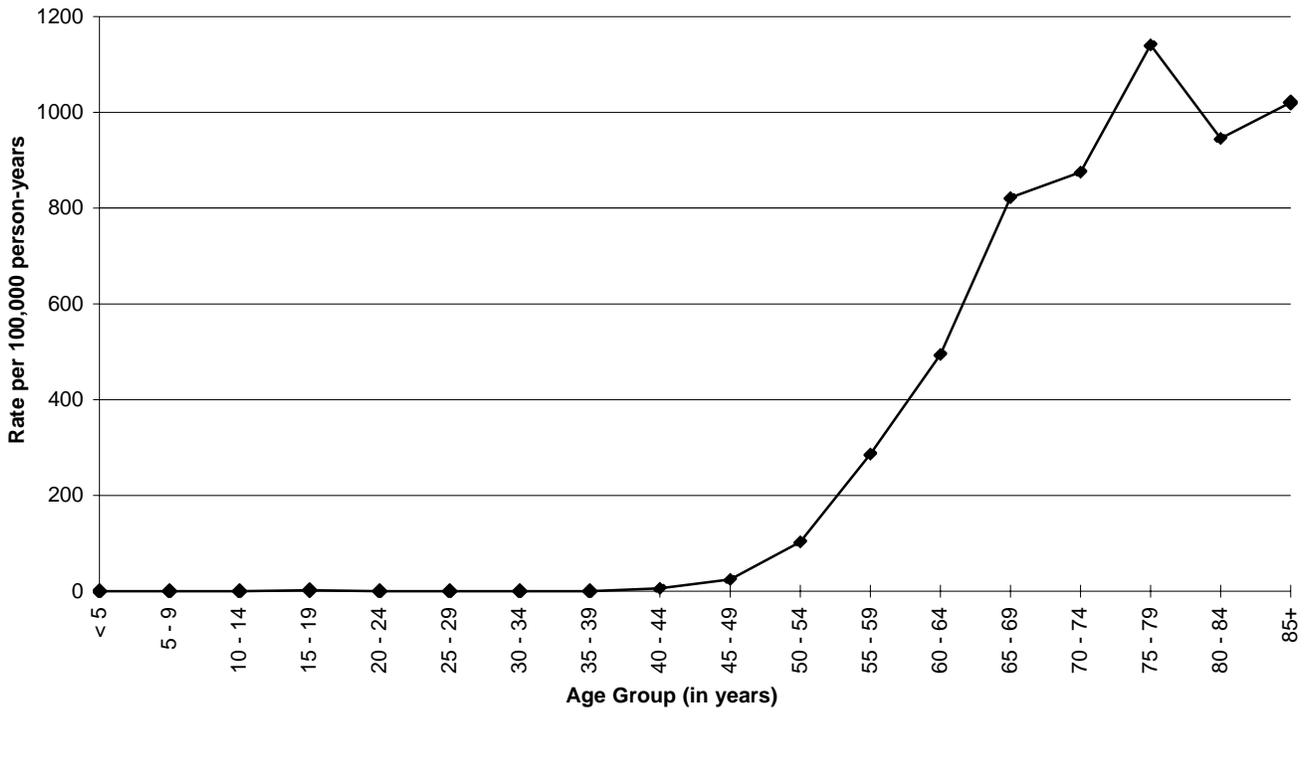

Age	It is rarely diagnosed before age 50, and it is primarily a disease of older men.
Race	African American males have a substantially higher rate than Caucasian males.
Genetics	A family history of prostate cancer is associated with increased risk.
Diet	Dietary fat has been implicated in several international, regional, and case-control studies.
Other	Environmental and familial factors may contribute to an increased incidence but no specific factor in these two groups of potential risk factors has been clearly identified. Three risk factors are well established: age, family history, and ethnic group/country of residence. Farming is the most consistent occupational risk factor for prostate cancer. Methyl bromide pesticide application has been identified as a risk factor by the Agricultural Health Study. It is likely that only a very small proportion of all prostate cancer cases can be attributed to a specific industrial chemical exposure.

Special Notes

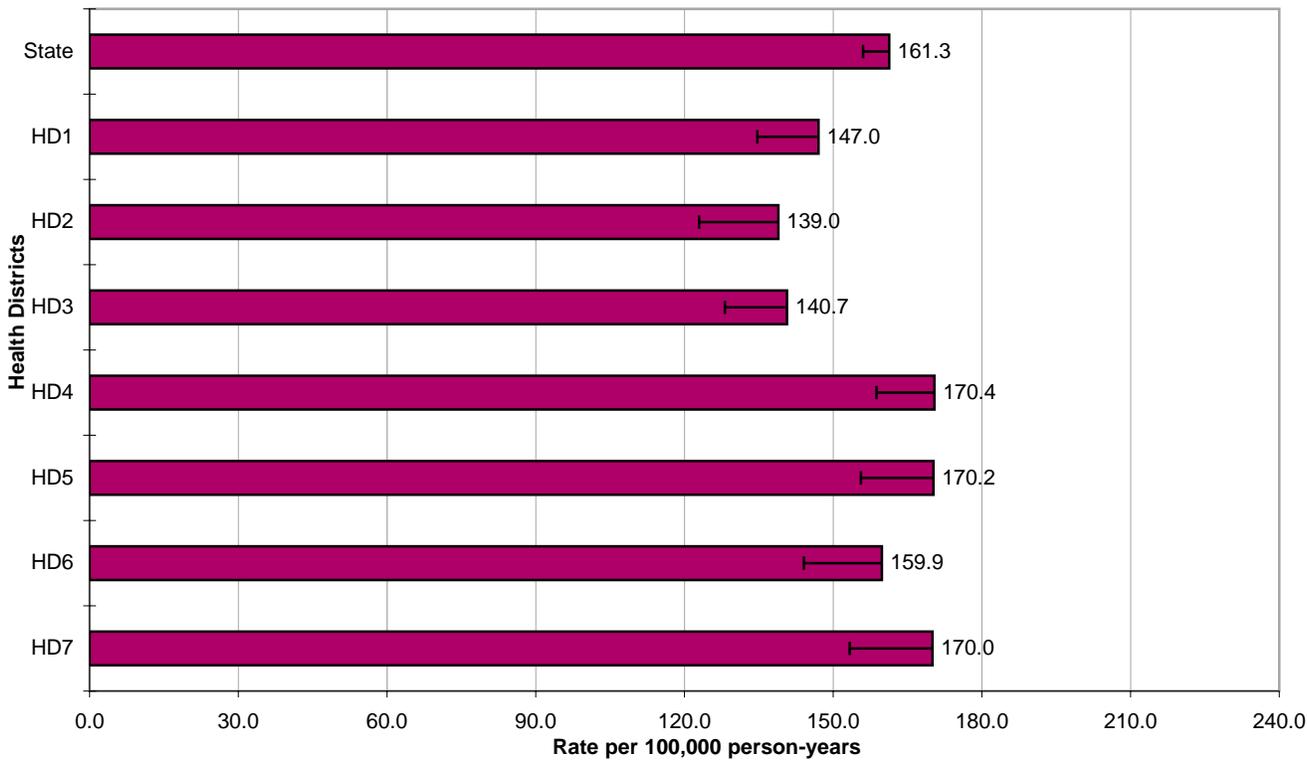

Mean age-adjusted incidence rate across health districts:	156.7
95% confidence interval on the mean age-adjusted incidence rate:	146.2 - 167.3
Median age-adjusted incidence rate of health districts:	159.9
Range of age-adjusted incidence rate for health districts:	139.0 - 170.4
SEER rate (2001, Whites):	173.5

The age-specific incidence rate distribution of prostate cancer in Idaho in 2003 is similar to that reported by the National Cancer Institute's SEER program. There were few cases of prostate cancer among persons aged less than 40 years. The age-specific incidence rates of prostate cancer increased with age, peaking in the 75-79 age group. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Stage at Diagnosis - Stomach

Risk and Associated Factors

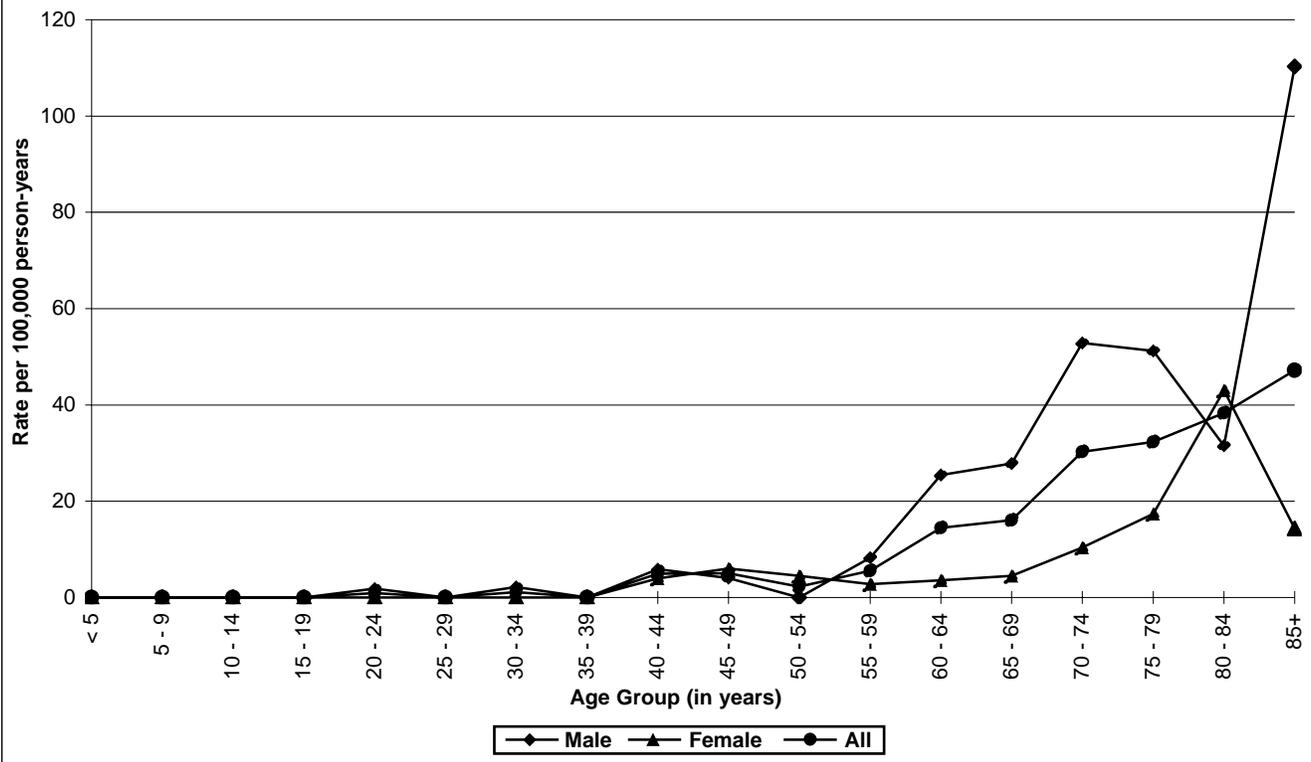

Age	Rates increase with age.
Gender	Incidence rates for males are usually more than twice as high as for females.
Race & SES	There is a higher incidence in African Americans, as well as Asians, and incidence is also higher in lower SES groups.
Diet	Increased risk has been attributed to diets high in smoked foods and foods high in nitrates. Salt and salted foods contribute to stomach cancer risk. Diets high in fresh fruits and vegetables seem to be protective.
Occupation	Elevated rates have been found in certain occupational groups, especially coal miners and asbestos workers and occupations with mineral dust exposure.
Other	Stomach cancer has recently been linked to peptic ulcer disease and to certain bacteria associated with increased risk for both diseases.

Special Notes

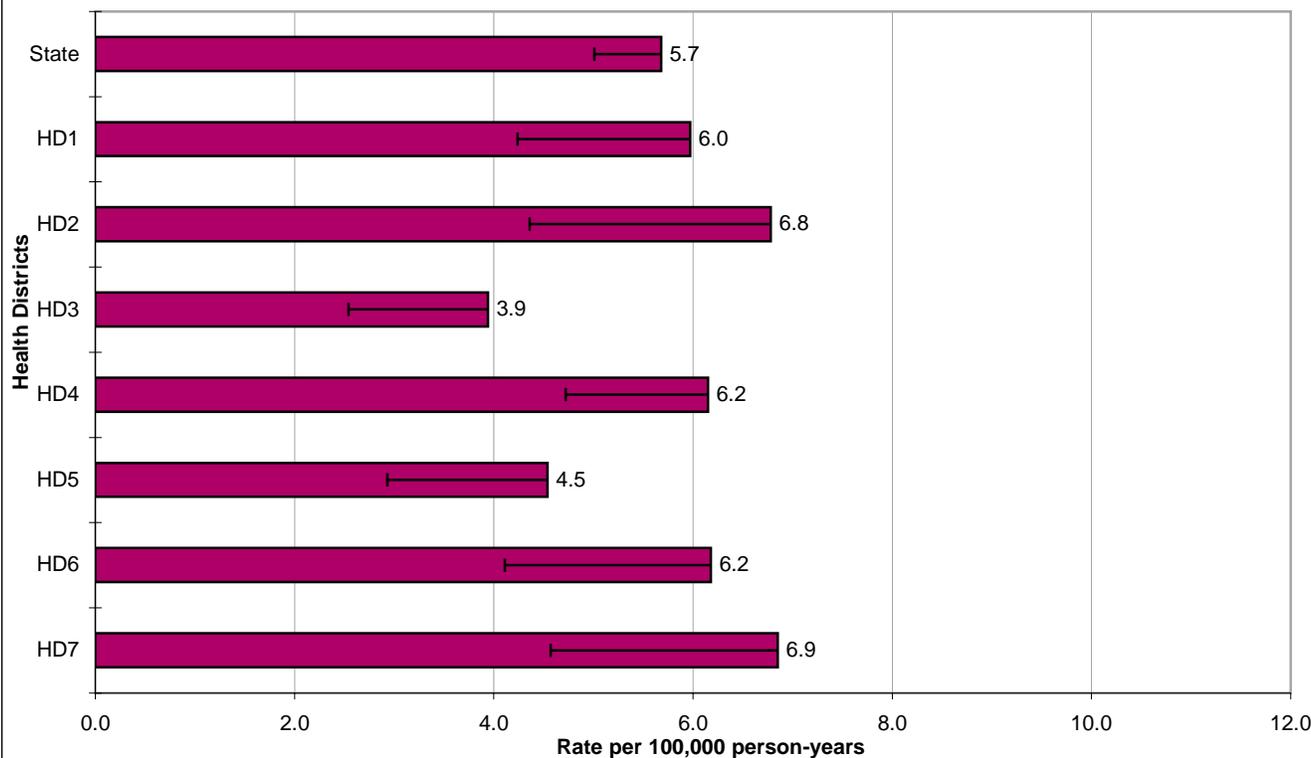

Mean age-adjusted incidence rate across health districts:	5.8
95% confidence interval on the mean age-adjusted incidence rate:	5.0 - 6.6
Median age-adjusted incidence rate of health districts:	6.2
Range of age-adjusted incidence rate for health districts:	3.9 - 6.9
SEER rate (2001, Whites):	6.3

There were few cases of stomach cancer among persons aged less than 55 years. The age-specific incidence rates of stomach cancer increased with age, peaking in the 85+ age group for males and 80-84 age group for females. No health district had statistically significantly fewer or more cases than expected based upon rates for the remainder of Idaho.

Caribou	-	Lemhi	-		

Stage at Diagnosis - Testis

Risk and Associated Factors

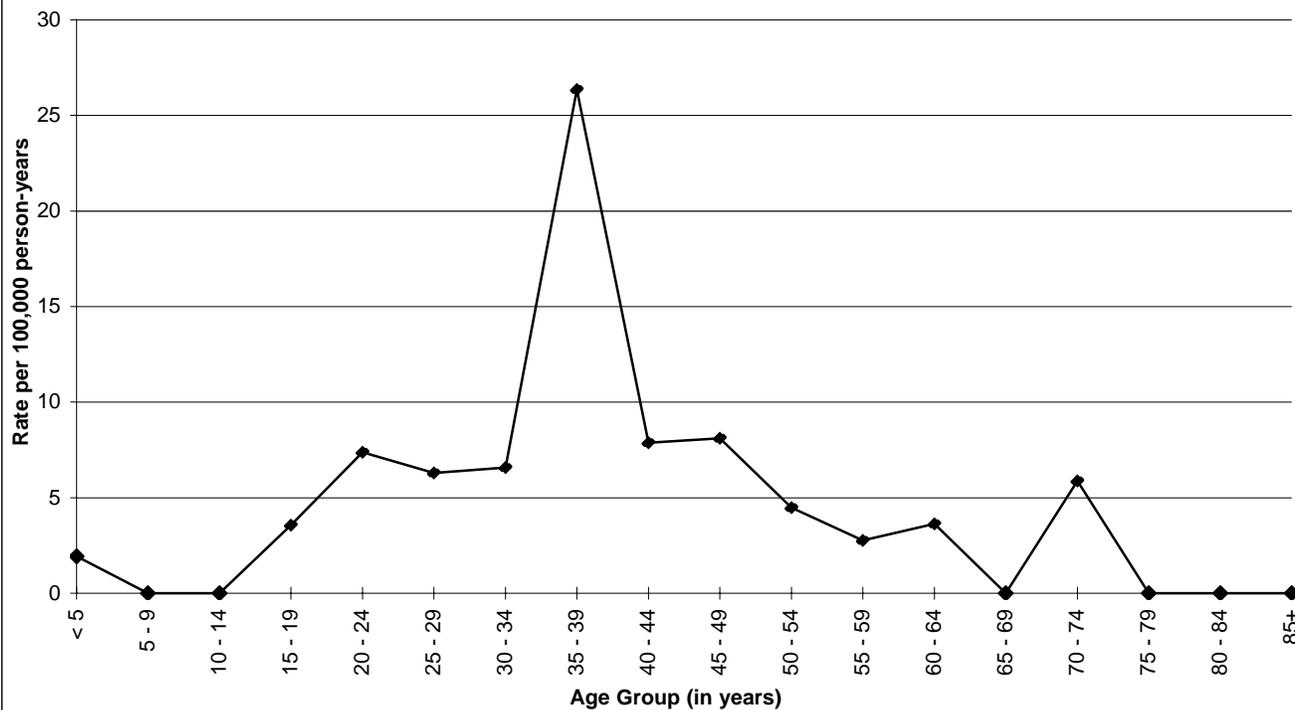

Age	This is the most common cancer in young males, especially males between the ages of 20 and 34.
Race & SES	Incidence rates are substantially higher in Caucasian males than in African American males. Incidence of testicular cancer is highest in highest socioeconomic classes.
Other	Undescended testis, a minor abnormality that can usually be detected and corrected with surgery in childhood, is responsible for a substantially high risk for testicular cancer when uncorrected. The extent to which surgical correction reduces cancer risk is unclear. Some evidence suggests that males exposed in utero to diethylstilbestrol (DES) are at increased risk. With current treatment the cure rates for testicular cancer are greater than 80%.

Special Notes

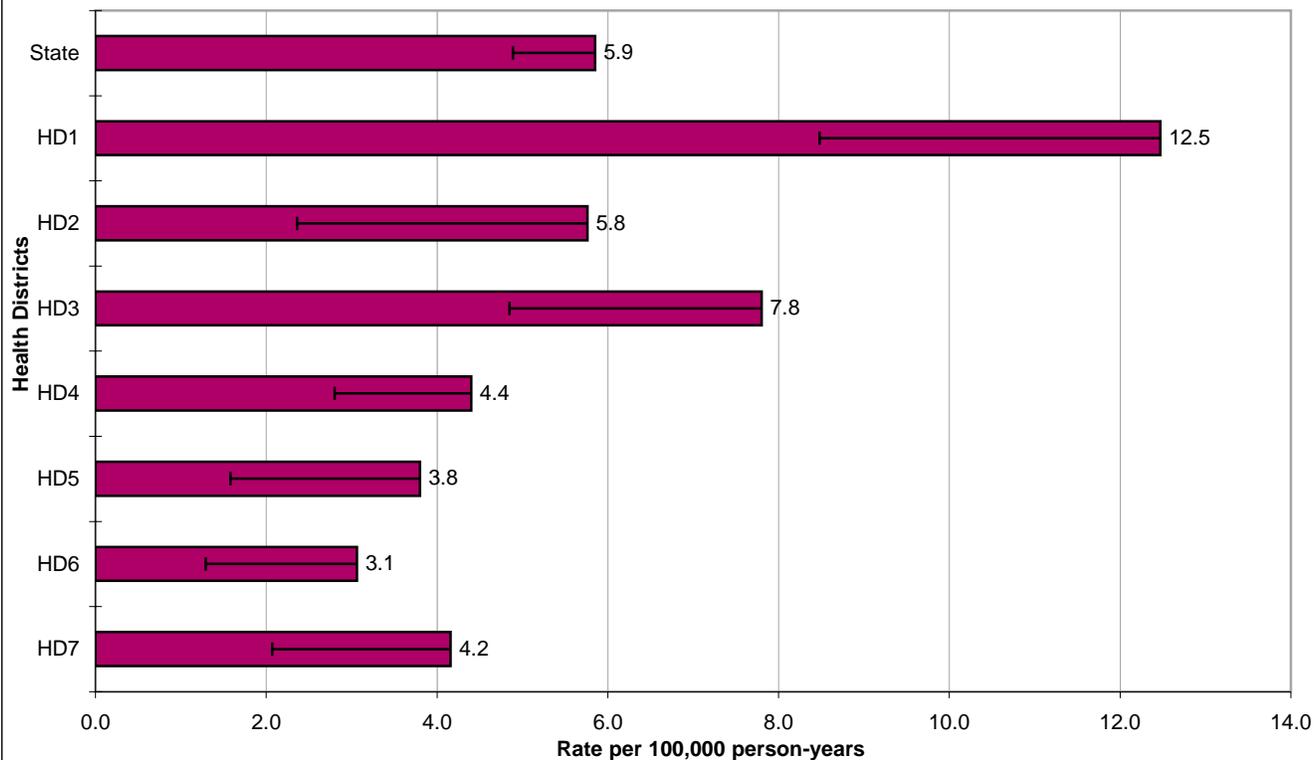

Mean age-adjusted incidence rate across health districts:	5.9

Stage at Diagnosis - Thyroid

Risk and Associated Factors

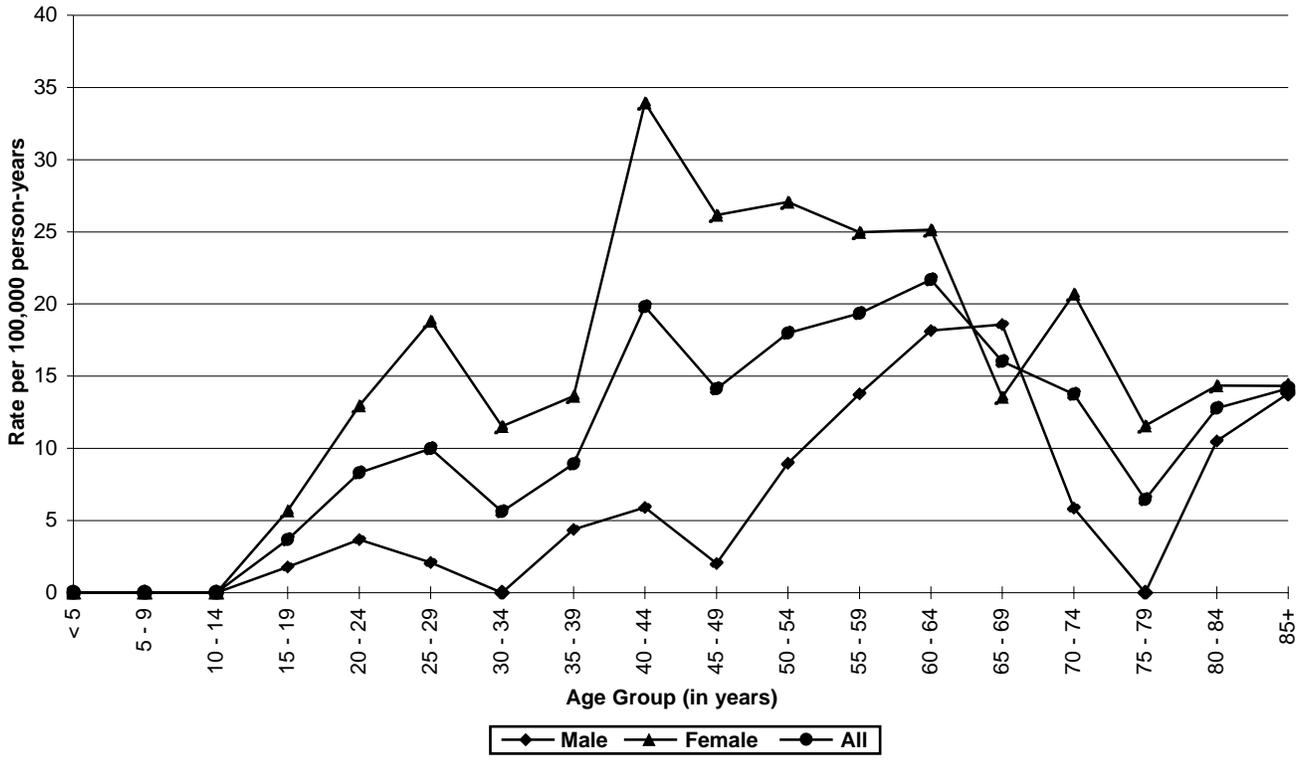

Age	Though relatively unusual, it is still one of the most common malignancies affecting adolescents and adults up to 50 years of age.
Gender	Two-thirds of the cases are among females.
Race & SES	The incidence is higher in Caucasians and in upper income groups.
Hormonal	Hormonal factors are believed to contribute to the increased risk in females. This is demonstrated by the sharp increase in incidence among women after menarche.
Other	Occupational and environmental exposures to ionizing radiation have been associated with higher rates of thyroid cancer. Radiation exposure to the head and neck in childhood is a well-known risk factor. Family history of thyroid cancer substantially increases the risk. Death due to thyroid cancer under age 40 is rare. Prognosis worsens with each decade of age over 50, partially because anaplastic thyroid cancer, which has a high fatality rate, occurs among older patients.

Special Notes

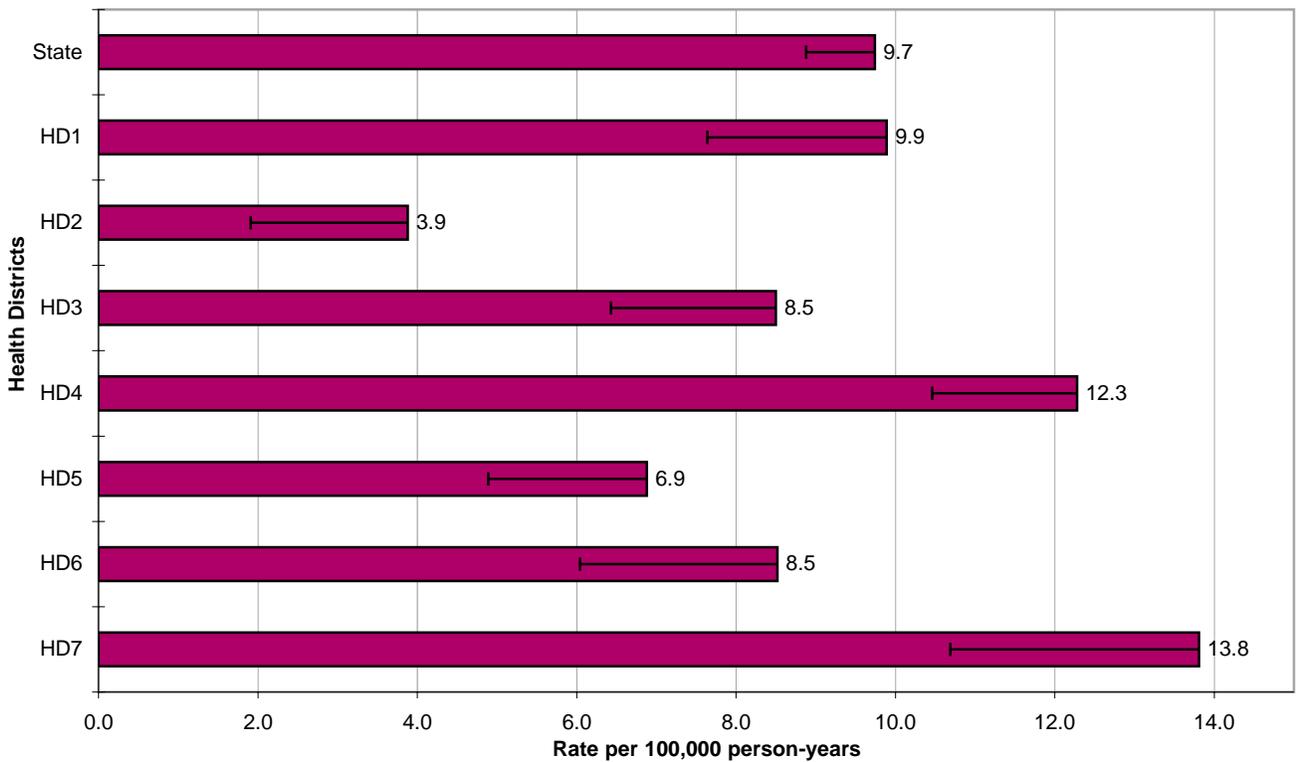

Mean age-adjusted incidence rate across health districts:	9.1
95% confidence interval on the mean age-adjusted incidence rate:	6.7 - 11.6
Median age-adjusted incidence rate of health districts:	8.5
Range of age-adjusted incidence rate for health districts:	3.9 - 13.8
SEER rate (2001, Whites):	8.4

The age-specific incidence rates of thyroid cancer were typically higher for females than males. Health District 4 had statistically significantly more cases than expected based upon rates for the remainder of Idaho ($p < 0.05$), and Health District 2 had statistically significantly fewer cases than expected based upon rates for the remainder of Idaho ($p < 0.05$).

* Source: Bureau of Health Policy and Vital Statistics, Idaho Department of Health and Welfare. ¹³

The manner of coding the underlying cause of death changed in 1999 from the ninth revision (ICD-9) to the tenth revision of the International Classification of Diseases (ICD-10). The introduction of ICD-10 resulted in a major reclassification of all causes of death from a numeric classification to an alphanumeric classification. The tenth revision also resulted in new titles for causes, the inclusion of terms and titles from one category to another, regroupings of diseases, and modifications of the coding rules. The introduction of ICD-10 created discontinuities in trend data for some causes of death; therefore, the numbers of deaths in 1999 and later years by site of malignant neoplasm may not be comparable to previously published data for numbers of deaths by site for years prior to 1999. The extent of the discontinuity is measured using a comparability ratio. The National Center for Health Statistics has constructed comparability ratios for the leading causes of death to measure the discontinuity between the data tabulated by the tenth revision and data tabulated by the ninth revision. The comparability ratio for malignant neoplasms based on ICD-10 (codes C00-C97) to ICD-9 (codes 140-208) is 1.01. For more information on ICD, comparability ratios, or Idaho cancer mortality trends, contact the Bureau of Health Policy and Vital Statistics, Idaho Department of Health and Welfare, at (208) 334-6658.

SECTION VI

RISKS OF DEVELOPING AND DYING FROM CANCER

Risks of Developing and Dying from Cancer

For Females

If your current age is:	Then your risk of <u>developing cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 81	1 in 23	1 in 10	1 in 5	1 in 3	1 in 2
40		1 in 31	1 in 11	1 in 5	1 in 3	1 in 2
50			1 in 16	1 in 6	1 in 3	1 in 2
60				1 in 8	1 in 4	1 in 3
70					1 in 6	1 in 3
80						1 in 4

If your current age is:	Then your risk of <u>dying from cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 617	1 in 130	1 in 40	1 in 16	1 in 8	1 in 5
40		1 in 163	1 in 42	1 in 16	1 in 8	1 in 5
50			1 in 56	1 in 17	1 in 8	1 in 5
60				1 in 24	1 in 9	1 in 5
70					1 in 14	1 in 6
80						1 in 9

For Males

If your current age is:	Then your risk of <u>developing cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 128	1 in 37	1 in 11	1 in 4	1 in 2	1 in 2
40		1 in 51	1 in 12	1 in 4	1 in 2	1 in 2
50			1 in 15	1 in 5	1 in 2	1 in 2
60				1 in 6	1 in 3	1 in 2
70					1 in 3	1 in 2
80						1 in 2

If your current age is:	Then your risk of <u>dying from cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 597	1 in 137	1 in 40	1 in 14	1 in 7	1 in 4
40		1 in 175	1 in 42	1 in 14	1 in 7	1 in 4
50			1 in 53	1 in 15	1 in 7	1 in 4
60				1 in 19	1 in 7	1 in 4
70					1 in 10	1 in 5
80						1 in 6

Risks of Developing and Dying from Cancer

Female Breast Cancer

If your current age is:	Then your risk of <u>developing breast cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 274	1 in 57	1 in 24	1 in 13	1 in 9	1 in 7
40		1 in 74	1 in 26	1 in 14	1 in 9	1 in 8
50			1 in 39	1 in 16	1 in 10	1 in 8
60				1 in 26	1 in 13	1 in 10
70					1 in 23	1 in 13
80						1 in 22

If your current age is:	Then your risk of <u>dying from breast cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 1967	1 in 410	1 in 155	1 in 81	1 in 50	1 in 33
40		1 in 514	1 in 166	1 in 84	1 in 51	1 in 34
50			1 in 241	1 in 99	1 in 56	1 in 35
60				1 in 160	1 in 70	1 in 40
70					1 in 110	1 in 47
80						1 in 61

Prostate Cancer

If your current age is:	Then your risk of <u>developing prostate cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 15272	1 in 421	1 in 42	1 in 12	1 in 7	1 in 5
40		1 in 427	1 in 42	1 in 12	1 in 7	1 in 5
50			1 in 45	1 in 12	1 in 7	1 in 5
60				1 in 15	1 in 7	1 in 5
70					1 in 10	1 in 7
80						1 in 11

If your current age is:	Then your risk of <u>dying from prostate cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in *	1 in 19976	1 in 1742	1 in 249	1 in 71	1 in 28
40		1 in 19679	1 in 1717	1 in 245	1 in 70	1 in 27
50			1 in 1825	1 in 241	1 in 68	1 in 26
60				1 in 260	1 in 66	1 in 25
70					1 in 75	1 in 23
80						1 in 22

Note: * Risks are not precise - best estimates are shown.

Risks of Developing and Dying from Cancer

Colon/Rectal Cancer in Females

If your current age is:	Then your risk of <u>developing colon/rectal cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 1932	1 in 452	1 in 159	1 in 63	1 in 32	1 in 20
40		1 in 584	1 in 172	1 in 64	1 in 33	1 in 20
50			1 in 239	1 in 71	1 in 34	1 in 20
60				1 in 96	1 in 38	1 in 21
70					1 in 55	1 in 24
80						1 in 31

If your current age is:	Then your risk of <u>dying from colon/rectal cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 11473	1 in 2742	1 in 682	1 in 237	1 in 104	1 in 51
40		1 in 3572	1 in 719	1 in 240	1 in 104	1 in 51
50			1 in 883	1 in 252	1 in 105	1 in 51
60				1 in 338	1 in 115	1 in 52
70					1 in 155	1 in 55
80						1 in 63

Colon/Rectal Cancer in Males

If your current age is:	Then your risk of <u>developing colon/rectal cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 2038	1 in 428	1 in 129	1 in 47	1 in 26	1 in 19
40		1 in 533	1 in 136	1 in 47	1 in 26	1 in 18

60				1 in 66	1 in 29	1 in 19
70					1 in 43	1 in 23
80						1 in 31

If your current age is:	Then your risk of <u>dying from colon/rectal cancer</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 7767	1 in 1386	1 in 437	1 in 148	1 in 70	1 in 45
40		1 in 1662	1 in 456	1 in 148	1 in 70	1 in 44
50			1 in 610	1 in 158	1 in 71	1 in 44
60				1 in 200	1 in 75	1 in 45
70					1 in 102	1 in 49
80						1 in 60

Risks of Developing and Dying from Cancer

Melanoma in Females

If your current age is:	Then your risk of <u>developing melanoma</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 712	1 in 282	1 in 160	1 in 105	1 in 77	1 in 64
40		1 in 464	1 in 204	1 in 122	1 in 86	1 in 69
50			1 in 357	1 in 163	1 in 103	1 in 80
60				1 in 286	1 in 139	1 in 99
70					1 in 241	1 in 134
80						1 in 223

If your current age is:	Then your risk of <u>dying from melanoma</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 15961	1 in 5420	1 in 2130	1 in 1181	1 in 638	1 in 465
40		1 in 8138	1 in 2437	1 in 1265	1 in 659	1 in 474
50			1 in 3413	1 in 1469	1 in 703	1 in 494
60				1 in 2471	1 in 848	1 in 554
70					1 in 1154	1 in 638
80						1 in 1062

Melanoma in Males

If your current age is:	Then your risk of <u>developing melanoma</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 757	1 in 292	1 in 130	1 in 74	1 in 52	1 in 43
40		1 in 469	1 in 155	1 in 81	1 in 54	1 in 44
50			1 in 224	1 in 95	1 in 60	1 in 48
60				1 in 153	1 in 76	1 in 56
70					1 in 126	1 in 75
80						1 in 119

If your current age is:	Then your risk of <u>dying from melanoma</u> by a particular age is:					
	By age 40	By age 50	By age 60	By age 70	By age 80	Ever
30	1 in 4071	1 in 1613	1 in 934	1 in 454	1 in 286	1 in 217
40		1 in 2633	1 in 1194	1 in 504	1 in 303	1 in 226
50			1 in 2118	1 in 604	1 in 332	1 in 240
60				1 in 791	1 in 369	1 in 253
70					1 in 584	1 in 315
80						1 in 443

APPENDICES

APPENDIX A

STANDARD SITE ANALYSIS CATEGORIES

SITE CATEGORY	PRIMARY SITE CODE
Categories in SMALL CAPITALS are aggregated from the groups indented under them	EXCLUDES histologic types 9590-9989
BUCCAL CAVITY & PHARYNX	
Lip	C00.0 - C00.9
Tongue	C01.9 - C02.9
Salivary Glands	C07.9 - C08.9
Floor of Mouth	C04.0 - C04.9
Gum and Other Mouth	C03.0 - C03.9 C05.0 - C05.9 C06.0 - C06.9
Nasopharynx	C11.0 - C11.9
Tonsil	C09.0 - C09.9
Oropharynx	C10.0 - C10.9
Hypopharynx	C12.9 C13.0 - C13.9
Other Buccal Cavity and Pharynx	C14.0 C14.2 - C14.8
DIGESTIVE SYSTEM	
Esophagus	C15.0 - C15.9
Stomach	C16.0 - C16.9
Small Intestine	C17.0 - C17.9
COLON (Excluding Rectum)	
Cecum	C18.0
Appendix	C18.1
Ascending Colon	C18.2
Hepatic Flexure	C18.3
Transverse Colon	C18.4
Splenic Flexure	C18.5
Descending Colon	C18.6
Sigmoid Colon	C18.7
Large Intestine, NOS	C18.8 - C18.9, C26.0

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from the groups indented under them	PRIMARY SITE CODE EXCLUDES histologic types 9590-9989
RECTUM AND RECTOSIGMOID	
Rectosigmoid Junction	C19.9
Rectum	C20.9
Anus, Anal Canal, & Anorectum	C21.0 - C21.2 C21.8
Liver	C22.0
Intrahepatic Bile Duct	C22.1
Gallbladder	C23.9
Other Biliary	C24.0 - C24.9
Pancreas	C25.0 - C25.9
Retroperitoneum	C48.0
Peritoneum, Omentum, & Mesentery	C48.1 - C48.2
Other Digestive Organs	C26.8 - C26.9 C48.8
RESPIRATORY SYSTEM	
Nasal Cavity, Middle Ear, & Accessory Sinuses	C30.0 - C30.1 C31.0 - C31.9
Larynx	C32.0 - C32.9
Lung and Bronchus	C34.0 - C34.9
Pleura	C38.4
Trachea, Mediastinum, & Other Respiratory Organs	C33.9 C38.1 - C38.3 C38.8 C39.0 C39.8 C39.9
BONES AND JOINTS	C40.0 - C41.9
SOFT TISSUE (Including Heart)	C38.0 C47.0 - C47.9 C49.0 - 49.9

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from the groups indented under them	PRIMARY SITE CODE EXCLUDES histologic types 9590-9989
SKIN (Excluding Basal and Squamous)	
Melanomas - Skin	C44.0 - C44.9 Histology Types 8720 - 8790 ONLY
Other Non - Epithelial	C44.0 - C44.9 Also Excluding Histology Types 8000 - 8004 8010 - 8045 8050 - 8082 8090 - 8110 8720 - 8790 9590 - 9989
BREAST	C50.0 - C50.9
FEMALE GENITAL SYSTEM	
Cervix Uteri	C53.0 - C53.9
Corpus Uteri	C54.0 - C54.9
Uterus, NOS	C55.9
Ovary	C56.9
Vagina	C52.9
Vulva	C51.0 - C51.9
Other Female Genital Organs	C57.0 - C58.9
MALE GENITAL SYSTEM	
Prostate	C61.9
Testis	C62.0 - C62.9
Penis	C60.0 - C60.9
Other Male Genital Organs	C63.0 - C63.9
URINARY SYSTEM	
Bladder	C67.0 - C67.9
Kidney and Renal Pelvis	C64.9 C65.9
Ureter	C66.9
Other Urinary Organs	C68.0 - C68.9
EYE AND ORBIT	C69.0 - C69.9

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from the groups indented under them	PRIMARY SITE CODE EXCLUDES histologic types 9590-9989
BRAIN AND OTHER NERVOUS SYSTEM	
Brain	C71.0 - C71.9 Also excludes: 9530 - 9539 And 9590 - 9989
Other Nervous System	A) C71.0 - C71.9 (meningioma) Histologic Type: 9530 - 9539 ONLY B) C70.0 - C70.9 C) C72.0 - C72.9
ENDOCRINE SYSTEM	
Thyroid	C73.9
Other Endocrine (Including Thymus)	C37.9 C74.0 - C74.9 C75.0 - C75.9

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from the groups indented under them	PRIMARY SITE CODE	HISTOLOGY
LYMPHOMAS		
Hodgkin's Disease		
Nodal	C02.4, C09.8, C09.9, C11.1, C14.2, C37.9 C42.2 C77.0 - C77.9	Types: 9650 - 9667 ONLY
Extranodal	For All Other Sites Exclude Sites: C02.4, C09.8, C09.9, C11.1, C14.2, C37.9, C42.2 C77.0 - C77.9	Types: 9650 - 9667 ONLY
Non - Hodgkin's Disease		
Nodal	C02.4, C09.8, C09.9, C11.1, C14.2, C37.9, C42.2 C77.0 - C77.9	Types: 9590 - 9596 9670 - 9729, 9823, 9827 ONLY
Extranodal	For All Other Sites Excluding Sites: C02.4, C09.8, C09.9, C11.1, C14.2, C37.9, C42.2 C77.0 - C77.9	Types: 9590 - 9595 9670 - 9729 ONLY Types: 9823, 9827 For All Other Sites Except C42.0, C42.1, C42.4
MULTIPLE MYELOMA	For All Sites	Types: 9731 - 9732 ONLY

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from groups indented under them	HISTOLOGY
LEUKEMIAS	
Lymphocytic	
Acute Lymphocytic	Type: 9821, 9828, ONLY
Chronic Lymphocytic	Type: 9823 ONLY
Other Lymphocytic	Type: 9820, 9822, 9824, 9825, 9826, ONLY
Granulocytic (Myeloid)	
Acute Granulocytic	Type: 9840, 9861, 9866, 9867, 9871 - 9874 ONLY
Chronic Granulocytic	Type: 9863, 9868, ONLY
Other Granulocytic	Type: 9860, 9862, 9864, ONLY
Monocytic	
Acute Monocytic	Type: 9891 ONLY
Chronic Monocytic	Type: 9893 ONLY
Other Monocytic	Type: 9890, 9892, 9894, ONLY
Other	
Other Acute	Type: 9801, 9841, 9931, 9932 ONLY
Other Chronic	Type: 9803, 9842 ONLY
Aleukemic, Subleukemic, & NOS	Type: 9800, 9802, 9804, 9830, 9850, 9870, 9880, 9900, 9910, 9930, 9940, 9941 ONLY Type 9827 For Sites C42.0, C42.1, C42.4 ONLY

SITE CATEGORY Categories in SMALL CAPITALS are aggregated from groups indented under them	PRIMARY SITE CODE EXCLUDES histologic types 9590-9989
ILL- DEFINED AND UNSPECIFIED SITES	A) Type: 9720 - 9723 9740 9741 9760 - 9764 9950 - 9989 ONLY For All Sites B) C76.0 - C76.8 C80.9 Type 8000 - 9589 C) C42.0 - C42.4 Type 8000 - 9589 D) C77.0 - C77.9 Type 8000 - 9589
INVALID SITE	Site or histology code not within valid range or site code not found in this table.
